

# The James Webb Space Telescope: The Next BIG Step in Exoplanets

C. Beichman, John Krist,  
Tom Greene, M. Rieke, Rene Doyon, et al.

ExoPag Meeting, Reno NV

Oct 14 2012

# JWST In a Nutshell

- BIG, COLD Telescope
  - 6.5m and 40K
  - Diffraction limited  $\sim 2 \mu\text{m}$
  - 131 nm wavefront error
- Big Budget
- 4 Instruments
- Stable L2 orbit
- Major components being delivered
- Some assembly required
- Launch by 2018<sub>-0</sub><sup>+?</sup>

# 4 Main Science themes

## First Light and Reionization:

Conduct deep surveys and follow-up spectroscopy for  $z \sim 7-15$

## The Assembly of Galaxies:

Measure shapes and colors of galaxies, identify young star forming clusters

## The Birth of Stars & Planets:

Identify and characterize protostellar objects, probe low and high mass ends of IMF

Follow chemistry through different phases of star formation

## Planetary Systems and the Origins of Life:

Image and characterize young gas giants

Characterize planetary atmospheres

Study planet-debris disks interactions

Study KBOs as debris disk parent bodies

# JWST Instruments

Deep, wide field broadband imaging

Wavefront Sensing & Control (WFSC)

Coronagraphic Imaging

Multi-Object, IR spectroscopy

IFU spectroscopy

NIRCam

NIRSpec

Long Slit spectroscopy

Fine Guidance Sensor

Moving Target Support

FGS/NIRISS

MIRI

Mid-IR, wide-field Imaging

NIRISS grism

Coronagraphic Imaging R~100

Mid-IR Coronagraphic Imaging

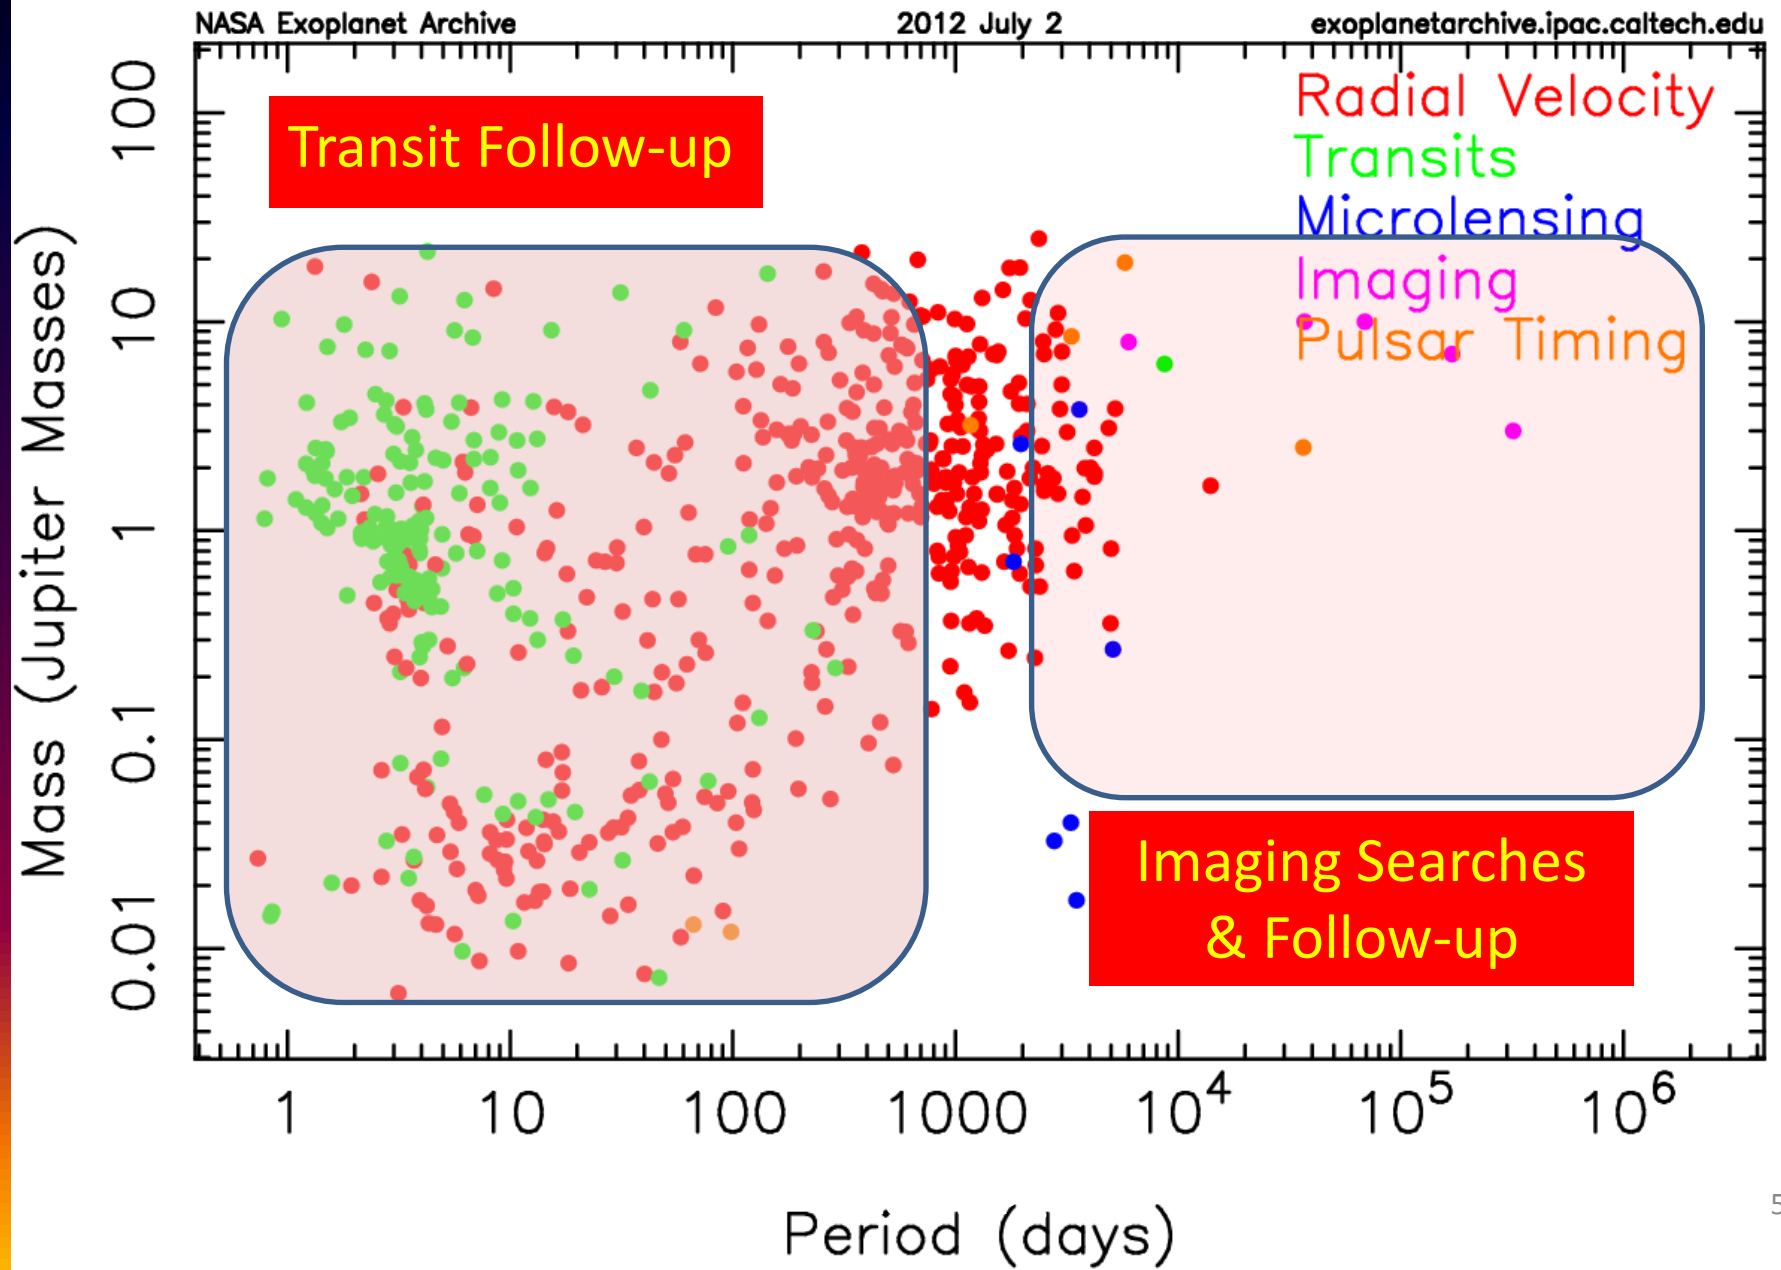

IFU spectroscopy

# Opportunities for ExoPlanet Science

# Planet Imaging with JWST

FWHM = 0.40"  
(6λ/D @ 2.1 μm)

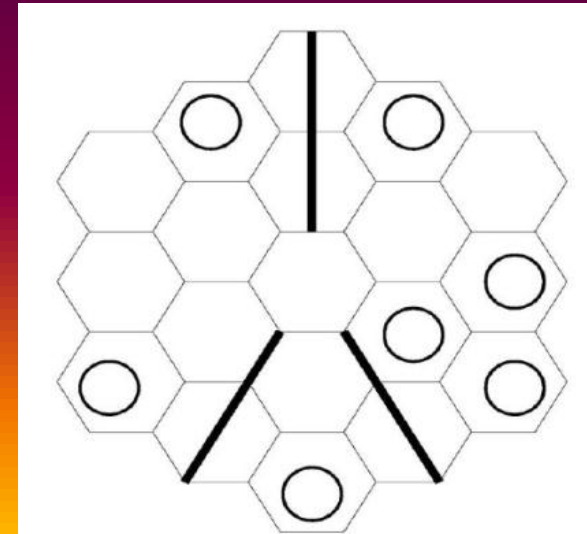

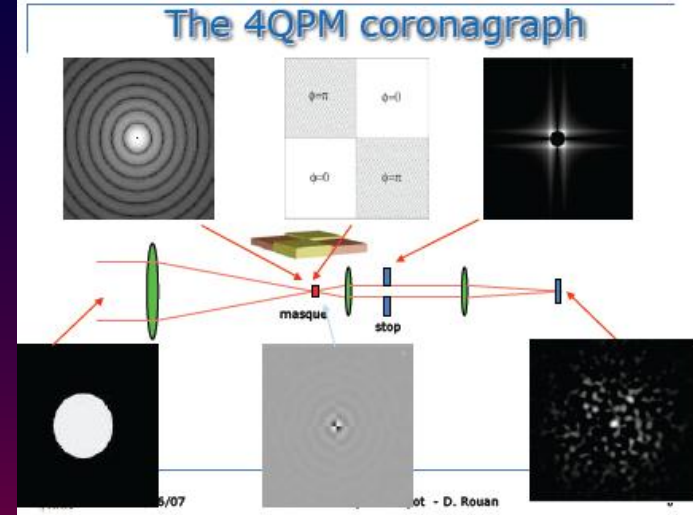

FWHM = 0.64"  
(6λ/D @ 3.35 μm)

FWHM = 0.82"  
(6λ/D @ 4.3 μm)

FWHM<sub>c</sub> = 0.58"  
(4λ/D @ 4.6 μm)

FWHM<sub>c</sub> = 0.27"  
(4λ/D @ 2.1 μm)

- Coronagraphs in 3 instruments
  - NIRCAM Lyot coronagraph for  $\lambda > 2 \mu\text{m}$  with both wedge- and circular occulters.
  - MIRI has 3  $\lambda$ -specific 4-Quadrant phase masks plus classical Lyot coronagraph
  - NIRISS non-redundant mask (NRM) for high spatial resolution images
- Ground-space competition
  - 8-10 m ground-based telescopes w ExAO win at  $\lambda < 2 \mu\text{m}$  and/or for IWA < 500 mas
  - JWST sensitivity advantage at  $\lambda > 3 \mu\text{m}$  where space background dominates over diffracted & scattered starlight

# NIRCAM Imaging

- Multiple Lyot coronagraphs tuned for JWST/NIRCAM filters placed to study hot Jupiter atmospheres

Multi-filter  
Combined, Unsubtracted

Red = F460M  
Green = F410M  
Blue = F360M

F460M  
Orient 1 – Orient 2 ( $10^\circ$ )

*Simulation by John Krist*

Multi-filter  
Combined, Subtracted

Planet  
4''

1 Gyr-old M0V star @ 4 pc  
2  $M_{\text{Jup}}$  planet @ 7 AU  
5000 sec / filter / orientation

# Direct Imaging of HR8799

- Highly stable PSF (few nm drift over few hours) with roll subtraction enables imaging of bright planets w/o coronagraph
  - SNR>50 on (50 Myr, 5 Mjup) at 3-5  $\mu\text{m}$  in 1800 sec
  - SNR>5 on (50 Myr, 0.5 Mjup) at 5  $\mu\text{m}$
- Better PSF, higher throughput but lower contrast
- Simulation properties in F405N narrow-band filter
  - 1000 $\times$ 0.181 subarray exposures (8.3" FOV) incl 4 roll angles
  - Known planets b,c,d,e (all 5 Mjup, 50 Myr COND models)
  - Plant 4 more planets at 0.5", 1.5", 2.5", and 3.5" (0.5 Mjup, 50 Myr)

# Coronagraph Status

- Coronagraphic masks fabricated by JPL and installed into NIRCam at LM
- Analysis suggests negligible impact of higher WFE segments when placed under struts hidden by Lyot mask

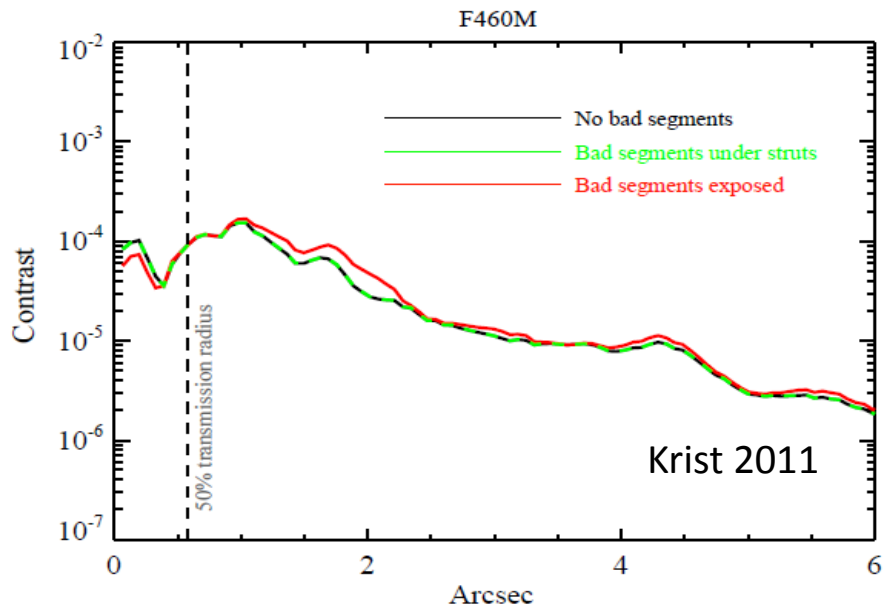

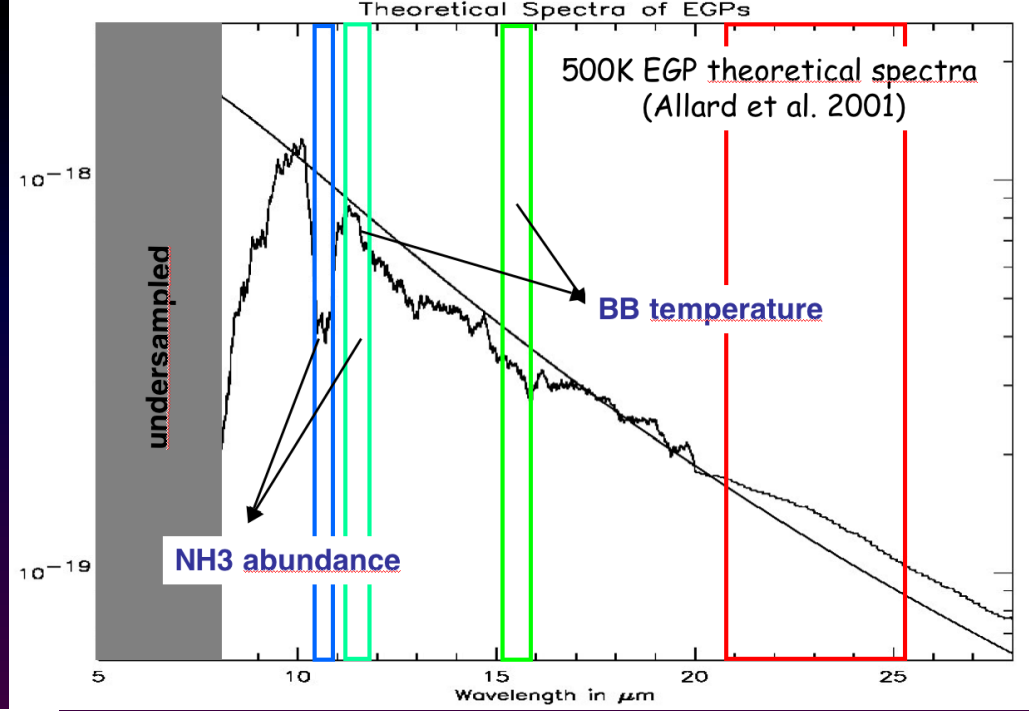

Figure 5. Azimuthal average profiles for F460M (long wavelength wedge) computed within sectors  $\pm 30^\circ$  from the vertical axis.

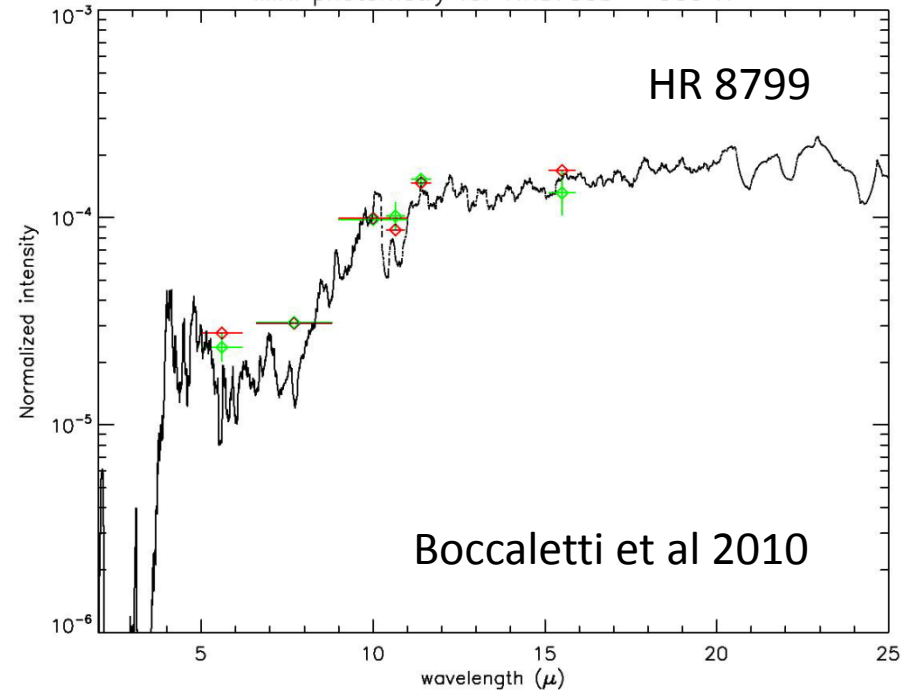

*NIRCam first light image*

# MIRI 4-Quadrant Phase Masks

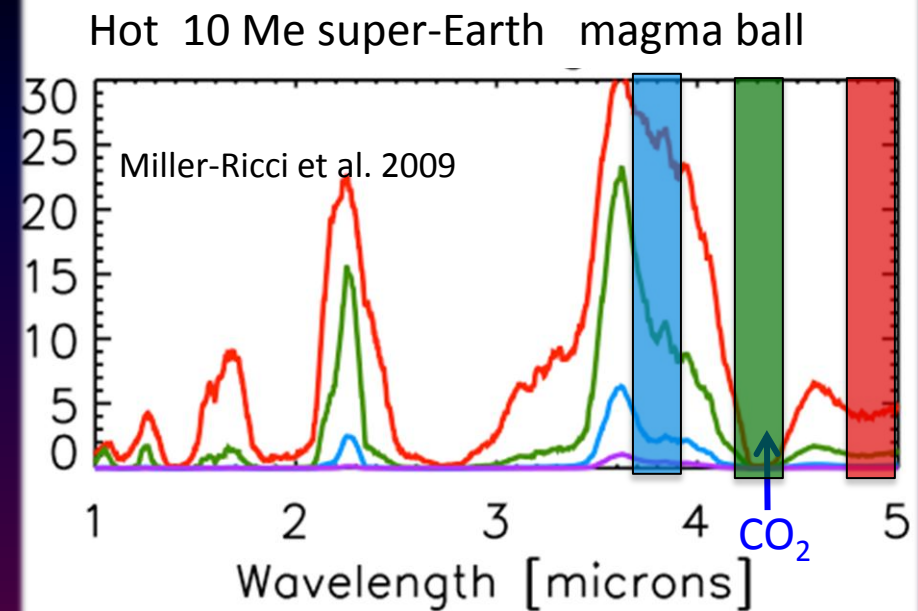

MIRI photometry for HR8799b – 900 K

# NIRISS: Aperture Interferometric Imaging (AMI)

- Non redundant mask provides very high resolution ( $0.5 \lambda/D$ ) at moderate contrast ( $10^{-4}$ ) and limited outer working angle.
- Medium-band filter set optimized for exoplanet SED; good diagnostic of  $T_{\text{eff}}$  and  $\text{Log } g$ .
- Complements NIRCam & MIRI.

## Non Redundant Mask

$\text{Res} \sim 0.5 \lambda/D_{\text{base}}$  (70 mas) out to  
 $\text{OWA} \sim \lambda/D_{\text{ap}}$  (400 mas) at  $4.6 \mu\text{m}$

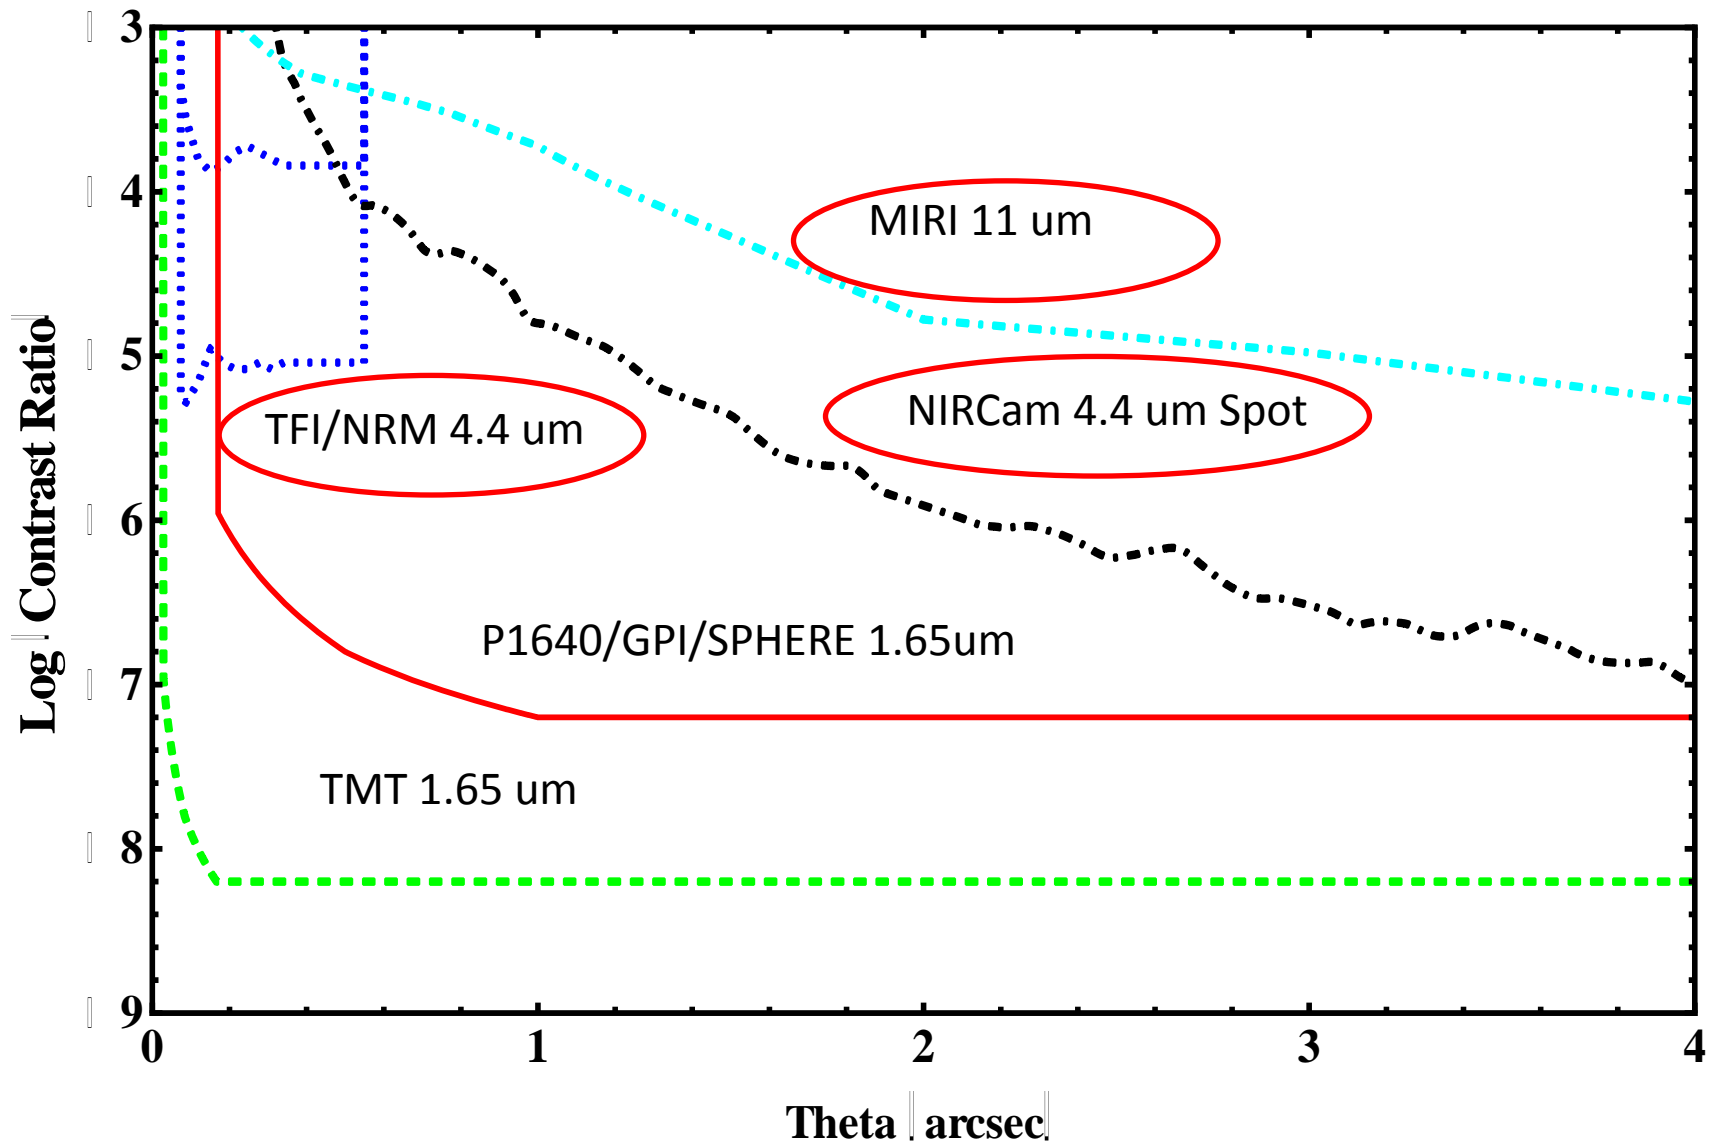

Pupil mask

Interferogram

# Comparison of Coronagraphic Capabilities: Ground and Space

# Sample of Nearby Young Stars

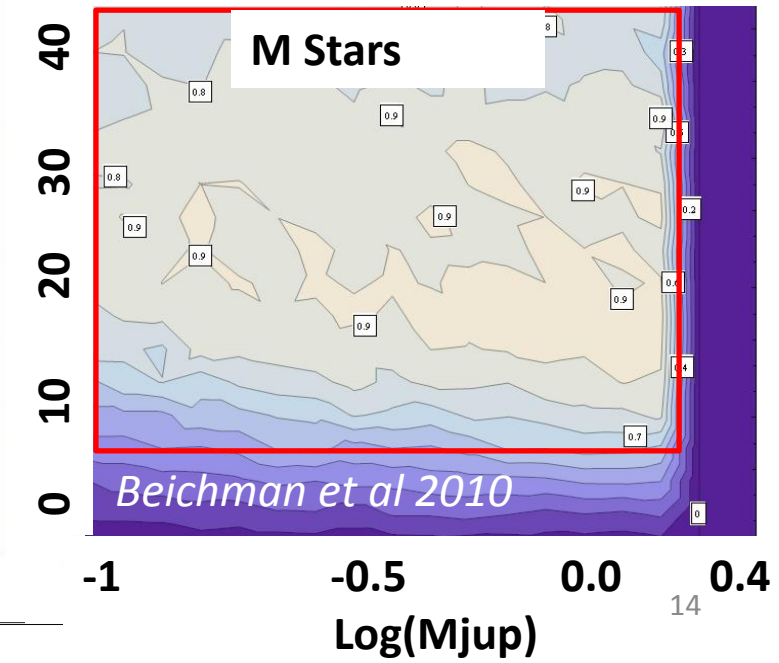

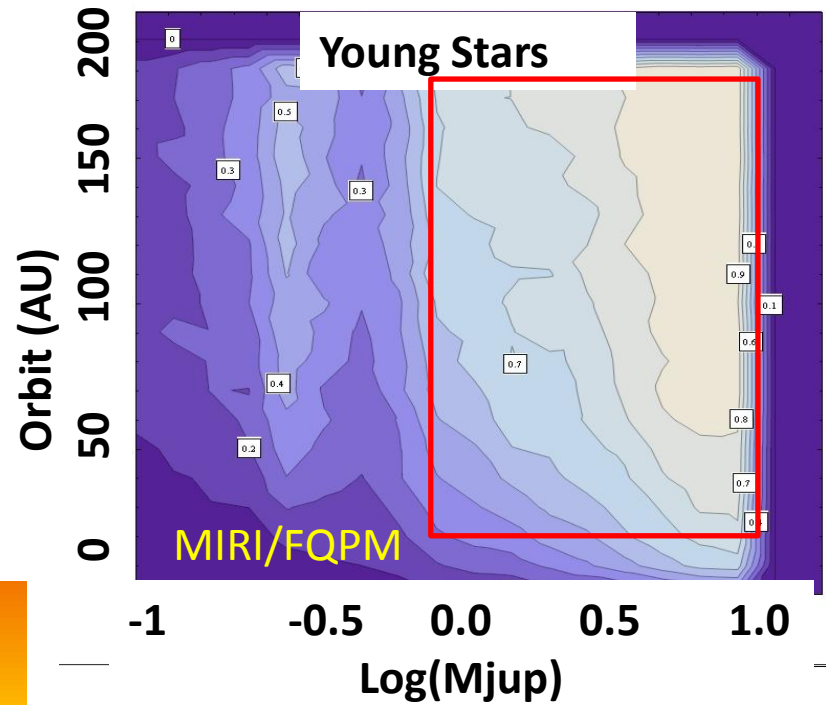

SIM Young Star Project	217
Spitzer FEPS Project	306
Spitzer plus nearby A stars	188
Nearby M stars (< 15 pc)	196

Cluster	Age (Myr)	Distance (pc)	Cluster	Age (Myr)	Distance (pc)
$\beta$ Pic	20	10-50	Pleiades	125	130
Tucanae	20	45	Chamaeleon	1-10	140
Horologium	30	60	Taurus-Aurigae	1-10	140
TW Hya	10	60	Upper Sco	1-10	145
ScoCen	5-20	130	IC2391	50	155

# Direct Imaging Survey

Nearby Young Stars finds Jupiters to Saturns

# Imaging Score Card

- NIRCAM/MIRI: highest sensitivity/contrast over large field.
- TFI/NRM: Youngest, closest-in planets
- Ground-based: Higher mass planets, closest-in (TMT)
- **Unique JWST science for nearby M stars too faint for Extreme AO**

Instrument	Avg Mass $M_{Jup}$	Avg. Age (Myr)	Avg SMA (AU)
NIRCam F440W	1.2	90	105
NIRCAM F356W	1.8	62	110
TFI/NRM ( $\sim$ F440N) <sup>1</sup>	2	16	35
TFI/NRM ( $\sim$ F440N) <sup>2</sup>	4	10	45
MIRI/FPQM	2.6	21	53
P1640	5.0	14	85
TMT	3.8	20	70

JWST (20  $\mu\text{m}$ )

Spitzer (24  $\mu\text{m}$ )

Visible (HST)

# JWST Extends Spitzer/Herschel/HST Results on Circumstellar Disks

Fomalhaut: HST images show evidence for exosolar planets

- Probe debris disks to complete picture of disk evolution
- Resolve disks & structures looking for rings, gaps, etc. Planets?
- Maps of scattered light and thermal emission to trace dust populations, composition (*3  $\mu\text{m}$  ice feature*), planet interactions
- Combined NIRCAM & MIRI observations for scattered and thermal emission

F360M coronagraph simulation of the HD 92945 debris disk. Disk is  $\sim 1/20$ th of  $\beta$  Pic disk,  $6 \times 10^{-4}$ .  
 Two 1000 sec exposures with 10 degree rotation, 2nm RMS change and 15 mas position shift  
 Reference PSF with a 5 nm change an another 15 mas offset  
 The PSF was subtracted from each and then the two registered in orientation and added.

# Kuiper Belt Objects As Debris Disk Parent Bodies

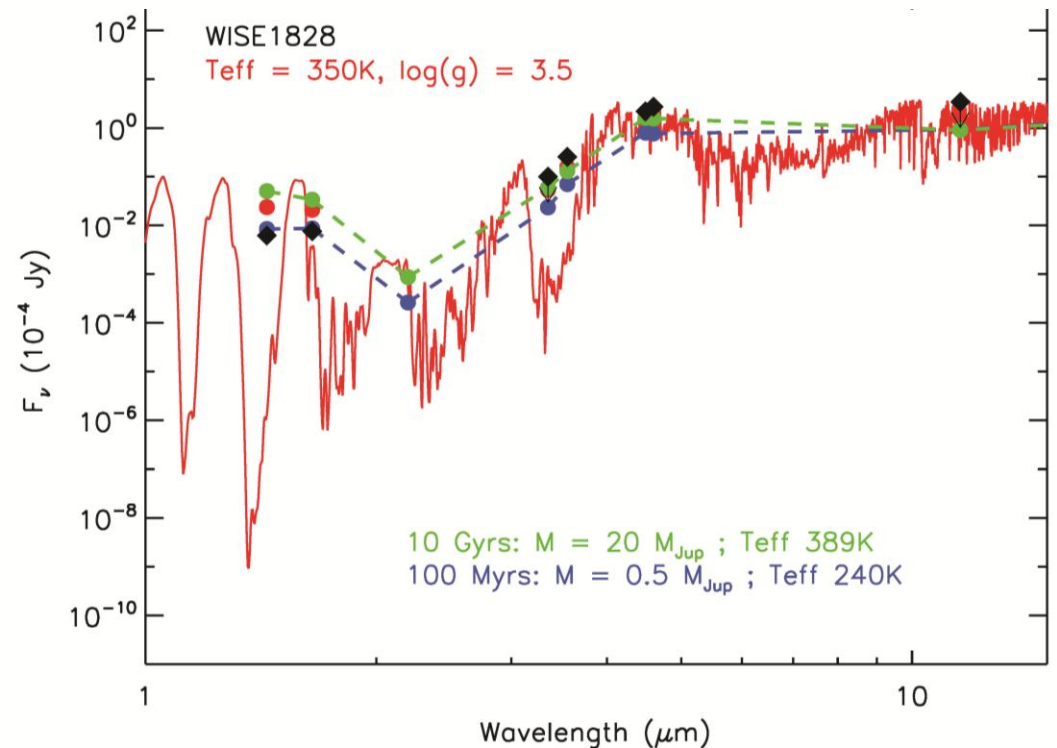

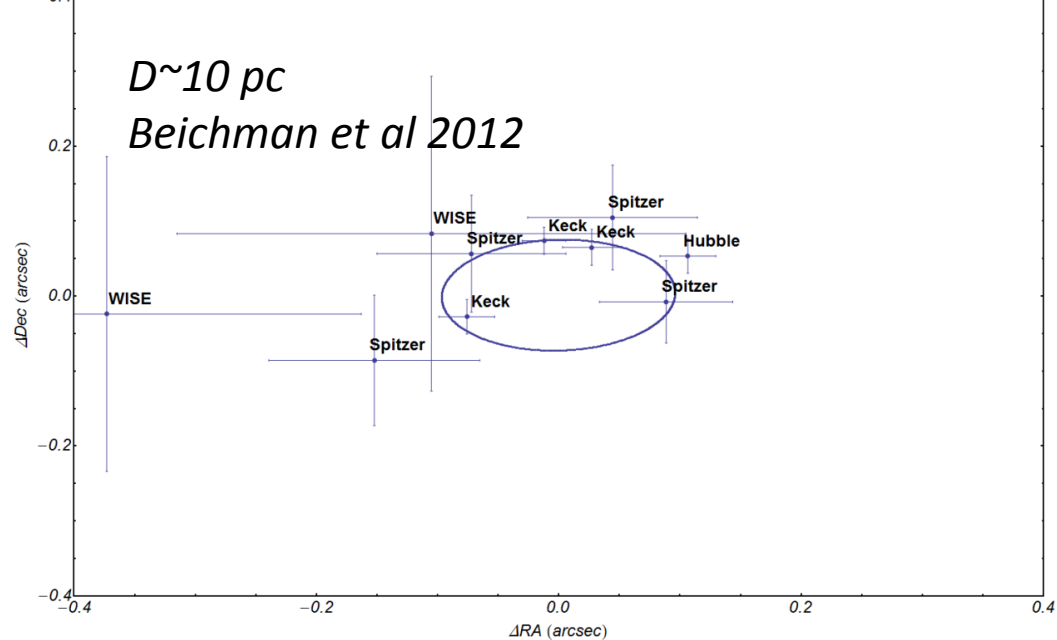

Phoebe

*Spectra from D = 220 km "KBO", Clark et al 2005*

- Filter photometry of dozens of KBOs with  $d > 100$  km at  $R \sim 100$  to investigate surface properties
- Astrometry for binaries  $\rightarrow$  mass & density

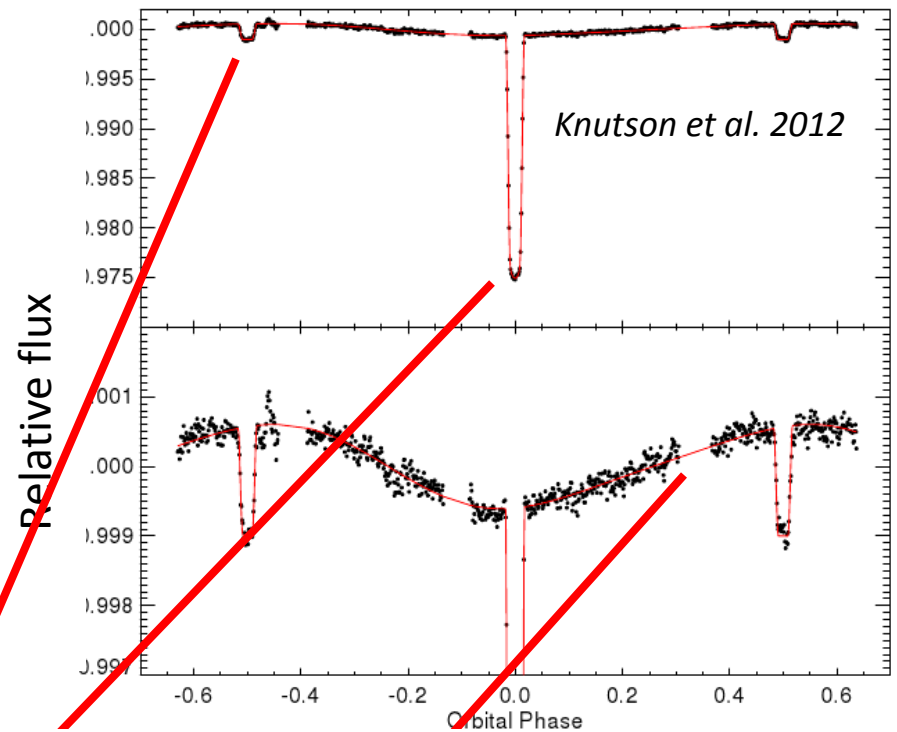

# Nearby Y Dwarfs: The Closest Planets?

- WISE & Spitzer objects
  - $T \sim 300$  K
  - Mass  $\sim 1\text{-}20 M_{\text{Jup}}$
  - Ages  $\sim 0.1\text{-}5$  Gyr
  - Distances  $< 20$  pc
- Astrometry and binarity
  - 100-200 mas parallax and 10s mas orbital motions detectable w. ref stars
- Bright sources ( $\geq 100 \mu\text{Jy}$ )
  - Grism and NIRSPEC spectra
  - Compare with spectra of bound planets formed via disk fragmentation

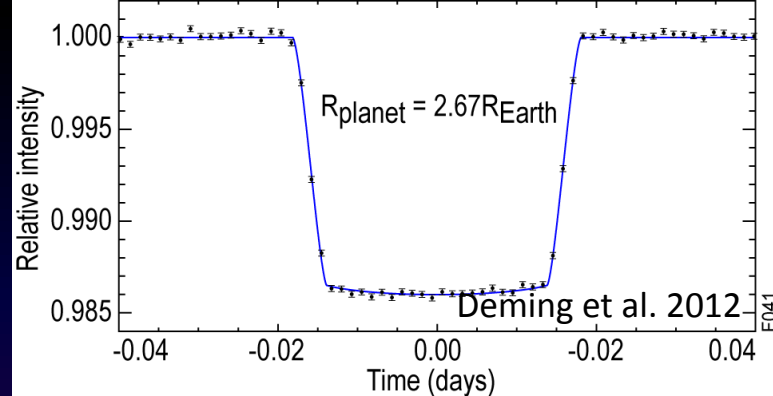

# JWST Transit Science

- High SNR/precision photometry & spectra from stable L2 orbit will revolutionize transit observations: 7.6xSNR(Spitzer), 2.7xSNR(HST)
- Wide spectral coverage (0.5-20  $\mu\text{m}$ ) and resolution ( $R \sim 5-2,000$ )

# Transit Science Opportunities

- Characterize Earths/Super Earths transiting M dwarfs
- Dayside temperature from secondary eclipse depths
- Composition (K, Na, CO<sub>2</sub>, CH<sub>4</sub>, H<sub>2</sub>O), atmospheric structure from multi-band secondary eclipses
- Global atmospheric circulation from full-phase light curves
- Validate & characterize smallest Kepler candidates orbiting brightest stars

Majeau, Agol & Cowan 2012

# All JWST Instruments Will Be Used For Transits

Instrument Mode	$\lambda$ ( $\mu\text{m}$ )	R ( $\lambda/8\lambda$ )	FOV	Application
NIRCam Imaging	0.6 - 2.3 2.4 - 5.0	4, 10, 100 4, 10, 100	2 x (2.2' x 2.2') 2 x (2.2' x 2.2')	High precision light curves of primary and secondary eclipses.
NIRCam Phase Diversity Imaging	0.6 - 2.3	4, 10, 100	Image diam. - 57 pixels - 114 pixels	High precision light curves of transits for bright targets that need to be defocused to avoid saturation within the minimum $t_{\text{int}}$
MIRI Imaging	5 - 29	4-6	1.9' x 1.4'	High precision light curves of secondary eclipses.
NIRISS grism	0.7-2.5	2000	slitless	High resolution spectra
NIRCam Spectroscopy	2.4 - 5.0	1700	2 x (2.2' x 2.2')	High precision transmission and emission spectroscopy
NIRSpec Spectroscopy	1.0 - 5.0	100, 1000, 2700	1.6'' x 1.6'' slit	Transmission and emission spectroscopy of transiting planets.
MIRI Spectroscopy	5 - 11	100	Slitless	High precision emission spectroscopy
MIRI Spectroscopy	5.9 - 7.7 7.4 - 11.8 11.4 - 18.2 17.5 - 28.8	3000 3000 3000 3000	3.7'' x 3.7'' 4.7'' x 4.5'' 6.2'' x 6.1'' 7.1'' x 7.7''	High precision emission spectroscopy

# NIRCam Can Study Bright Stellar Transits

Subarray Size (Pixels)	Exposure Time(sec)	Rate (sec)	Brightest in focus Source (K mag)	Brightest defocused Source (K mag)	Size Short- $\lambda$ (arc sec)	Size Long- $\lambda$ (arc sec)
16x16	.00256	.00768	5.3	N/A	0.5	1.0
48x48	.023	.069	7.6	N/A	1.5	3.1
<b>96x96</b>	<b>.092</b>	<b>.28</b>	<b>9.2</b>	<b>3.8</b>	<b>3.0</b>	<b>6.2</b>
<b>160x160</b>	<b>.256</b>	<b>.77</b>	<b>10.3</b>	<b>3.4</b>	<b>5.1</b>	<b>10.4</b>
320x320	1.02	3.1	11.8	N/A	10.1	20.8
640x640	4.1	12.2	13.3	N/A	20.3	41.6
<b>1024x16</b>	<b>0.16</b>	<b>0.48</b>	<b>3.3</b>	<b>N/A</b>	<b>N/A</b>	<b>Grism spec.</b>
<b>Full Frame*</b>	<b>10.6</b>	<b>31.8</b>	<b>14.3</b>	<b>N/A</b>	<b>135*</b>	<b>135</b>

- Subarrays to observe bright stars with grism
- NIRCam weak lenses to defocus stars at short lams for better sampling and less saturation on bright stars (2" - 4" diameter)

# NIRISS: Near-IR Transit Spectroscopy

- Spectral resolution: 700, slitless, cross-dispersed
- Simultaneous wavelength range: 0.7-2.5  $\mu\text{m}$ 
  - Includes key atmospheric features of  $\text{H}_2\text{O}$ ,  $\text{CO}_2$  and  $\text{CH}_4$
- Optimized for bright targets:  $J > 5$  mag
  - Spectrum is defocussed along spatial direction for high dynamic range operation and to minimize systematic errors due to flatfield (intra-pixel response) and jitter.

**GJ1614b with NIRISS**  
(~7 hrs, 5 visits)

# Spectra Need Bright

## Transit Targets

- Ground-based surveys have identified planets transiting bright stars (117 objects w  $K < 11$  mag) with many more to come
- **TESS** would find tens of super Earths orbiting bright stars...
- ...but **FINESSE** team has identified  $>100$  objects suitable for detailed spectra **NOW**
- Stay tuned for downselect in March!

FINESSE

TESS

# JWST Detectors Capable of High Precision Transit Performance

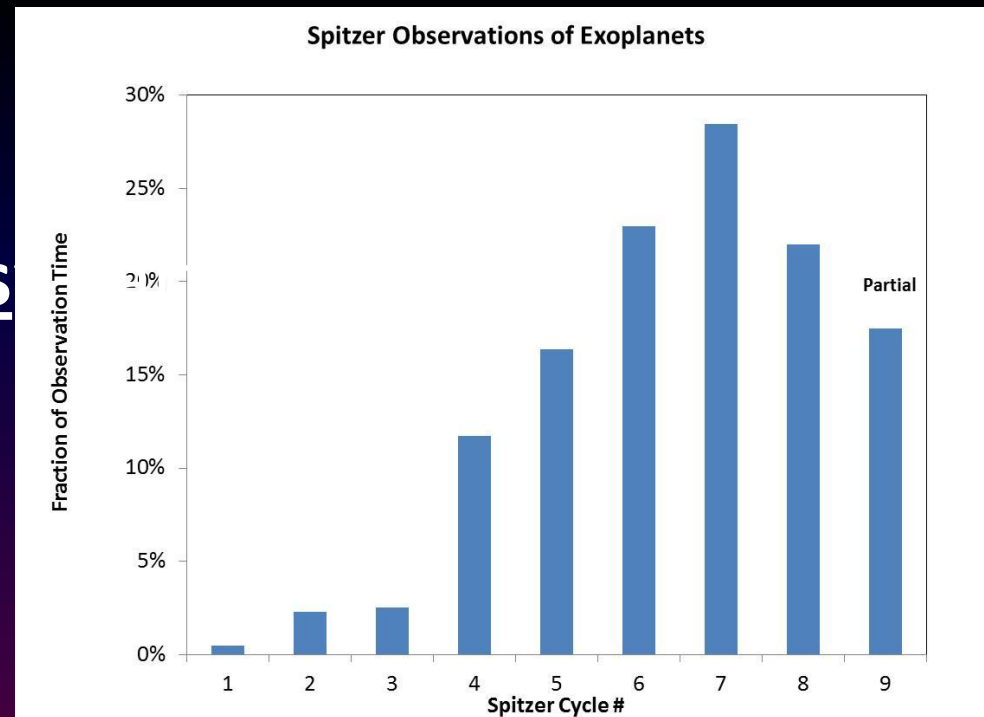

- H2RG device similar to JWST detectors show noise performance <50 ppm and potentially as good as <20 ppm

- Decorrelation removes disturbances due to pointing motion, temperature drifts, etc
- Testbed investigating spectroscopic performance. Initial results <50 ppm for simulated spectra

# Goals for Exoplanet Community

- Make the “New Worlds of “New Worlds, New Horizons” a reality
- Reclaim JWST from cosmologists
  - Win more than our fair share with a goal of capturing 25% of mission time
  - Plan comprehensive science programs
- Start preparing now to make sure JWST will do all that it is capable of providing for exoplanets

# Optimize JWST For Exoplanet Observations

- Careful pupil alignment and optimized wavefront for coronagraph campaigns
- Multi NIRCam readouts
  - Fast subarray readout for transit target in grism module
  - Slower, full array for pointing references in other module
- Long duration, highly stable uninterrupted data acqn periods essential. **JWST limit of 9,000 sec problem if not mitigated**
- High cadence data storage for light curves (10-30 sec)
