Overview

- Key Technology Gaps
- Error Budget Reduction
- Work Scope
 - Preliminary Analyses
 - Material Testing
 - Petal Creep Predictions
- Summary

* jpl.nasa.gov

Addressing Key Technology Gaps

- Deployment Accuracy and Shape Stability
 - Combined analysis/test approach
 - Targeting estimates on Starshade petal dimensional stability
 - Petal dimensional stability driven by material dimensional stability

Starshade Technology Gaps

Starlight Suppression

S-1: Controlling Scattered Sunlight

Formation Sensing and Control

S-3: Lateral Formation Sensing

Deployment Accuracy and Shape Stability

S-2: Starlight Suppression and Model Validation

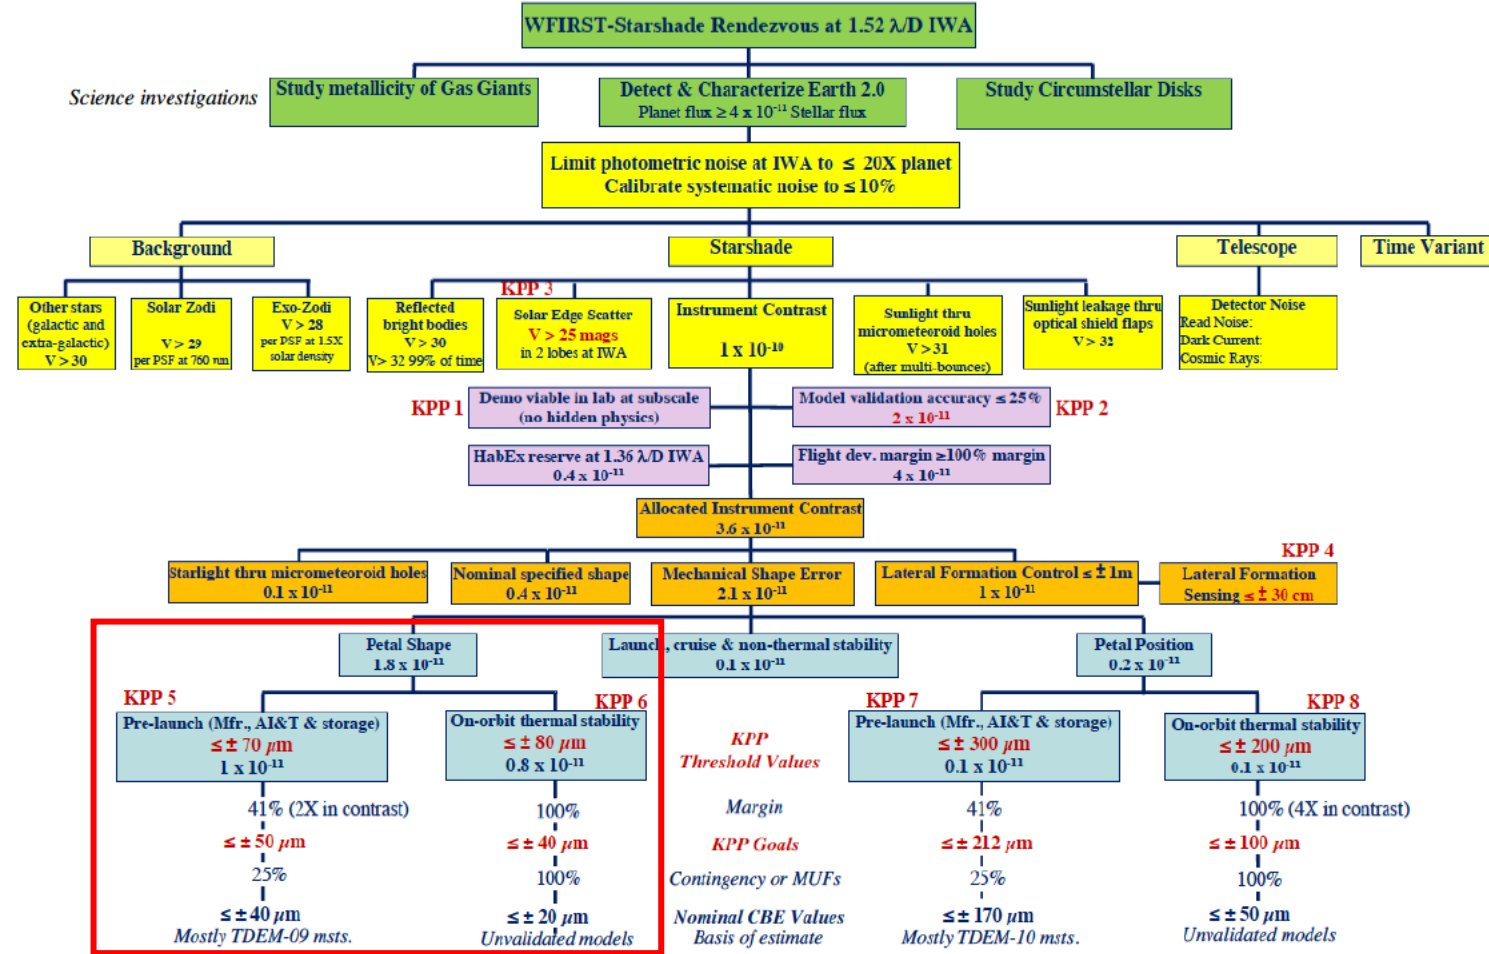

S-4: Petal Shape And Stability

S-5: Petal Positioning Accuracy and Opaque Structure

* Starshade to TRL5 (S5) TDP

Error Budget Reduction

- Opterus work addresses Petal Shape
 - KPP 5 ($\leq \pm 40 \mu\text{m}$)
 - KPP 6 ($\leq \pm 20 \mu\text{m}$)
- Pre-launch and on-orbit shape stability are relevant
- Efforts focus on pre-launch shape stability of prototype petal design

* Starshade to TRL5 (S5) TDP

Work Scope

Goal: Evaluate Starshade petal dimensional stability as a function of materials and stowage

Technical Progression

1. Preliminary Petal Edge Analyses
2. Coupon Level Material Testing
3. Petal Stowage Creep Predictions

Preliminary Petal Edge Analyses

- How does material selection influence time-dependent response to stowage?
- CFRP laminates and epoxy adhesive are time-dependent!
- Lots of CFRP resin systems out there...how does varying the resin impact time-dependent deformations?
 - Neat resin?
 - Toughened?
 - Filled?
 - Toughened and filled? →

* 2019 Optical Edge SPIE Presentation - Advancements in precision edges for a starshade external occulter

#	Resin Identifier	Resin Description	Nanosilicate	Toughener
1	F7C	Pure epoxy	No	No
2	F7	Epoxy with toughener	No	Yes
3	Epoxy (38% NS)	Epoxy with nano-silicates, no toughener	38%	No
4	F7 (10% NS)	Epoxy with toughener and nano-silicates	10%	Yes
5	F6	Cyanate ester	N/A	N/A

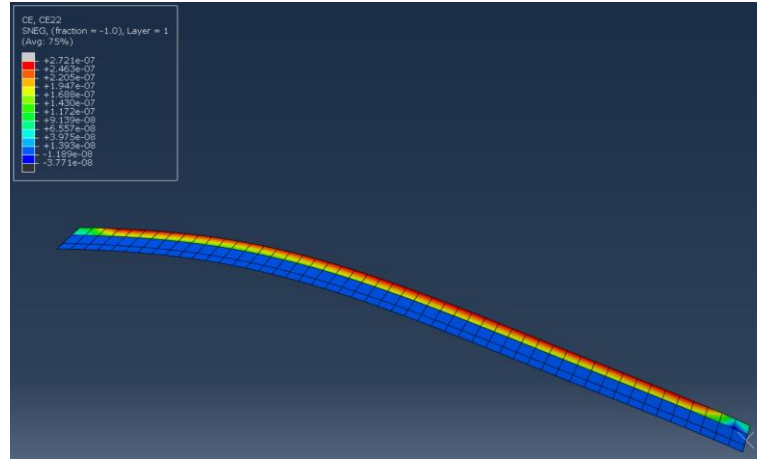

Preliminary Petal Edge Analyses

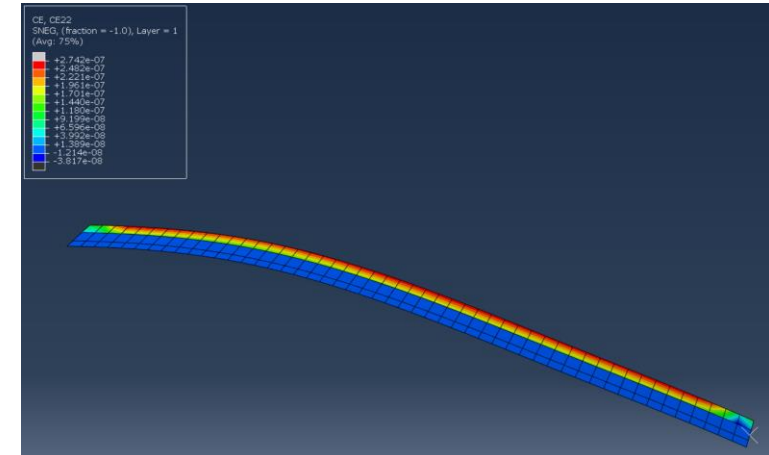

Petal Edge: Unloaded

Petal Edge: Load Applied

Petal Edge: Load Held for Time

Stow petal edge (constant load) – observe time-dependent deformations

Preliminary Edge Analyses: Results & Outcomes

#	Resin Identifier	Resin Description	Tip Displacement (m)	Edge Elastic Strain ($\mu\epsilon$)	Edge Creep Strain ($\mu\epsilon$)	CFRP Visco.
1	F7C	Neat epoxy	0.121	286.4	0.274	On
2	F7	Epoxy w/ T	0.121	286.4	0.274	On
3	F3GHT	Epoxy w/ NS	0.120	284.6	0.273	On
4	F7 10%	Epoxy w/ T and NS	0.122	289.7	0.277	On
5	F6	Neat cyanate ester	0.120	284.3	0.272	On
6	F7	Epoxy w/ T	0.122	283.8	0.274	Off

*T = toughener, NS = nanosilicates, all reported values correspond to 5 minute stow (i.e. load still applied)

Key Outcomes

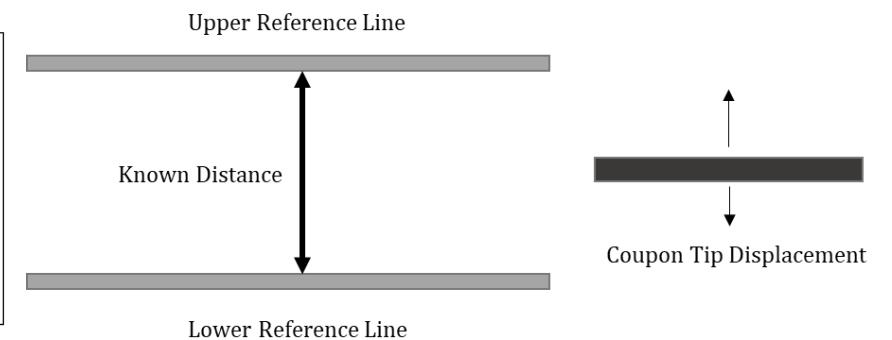

1. Time-dependent deformations small compared to elastic deformations
2. Time-dependent deformations minimally influenced by changing CFRP resin
3. Time-dependent deformations dominated by epoxy bond lines (EA9394)

Coupon Level Material Testing

- CFRP time-dependency has little impact on edge creep under load
- What about changes in environment?
 - Time
 - Temperature
 - Moisture
- Candidate materials narrowed for testing
 - Toughened epoxy (F7)
 - Cyanate ester (F6)
 - Epoxy adhesive (EA 9394)

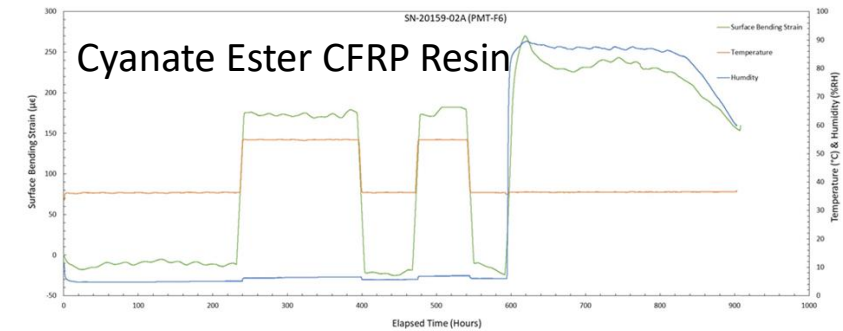

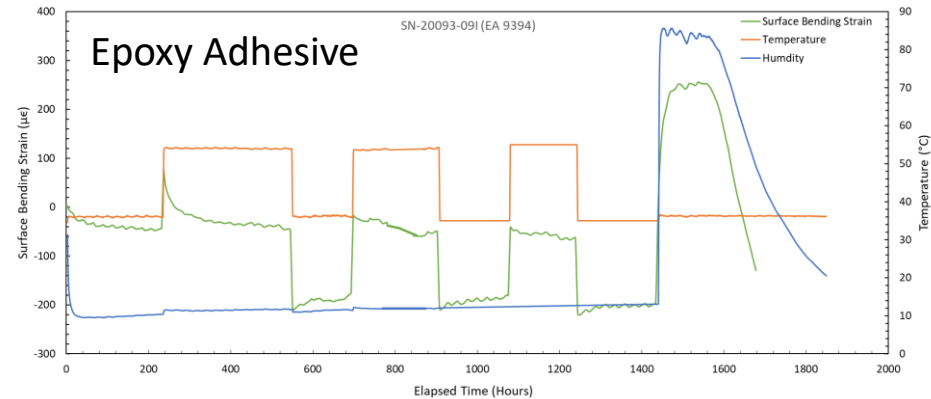

* <https://sites.google.com/site/simplestudyiti/instrument-mechanic/theory/measurement-of-temperature>

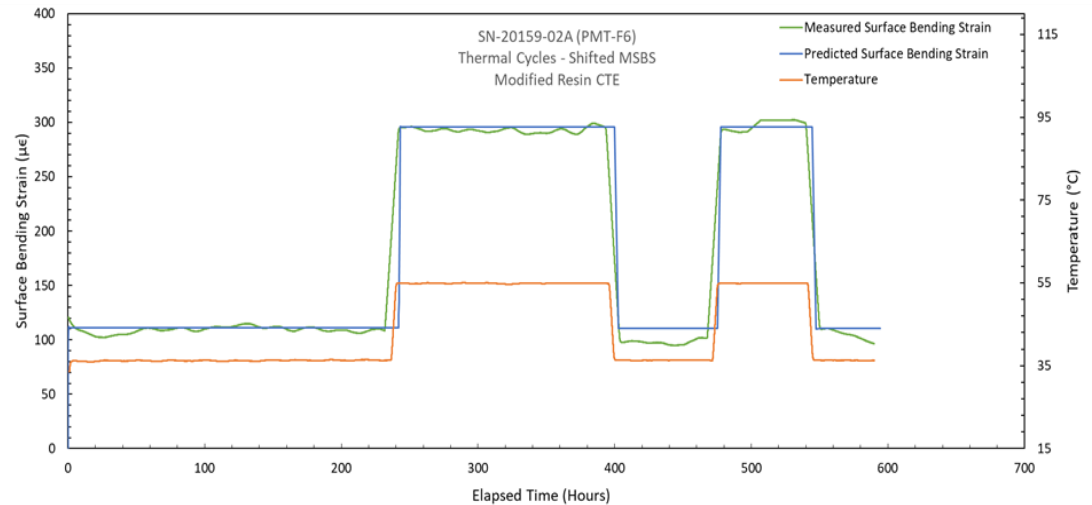

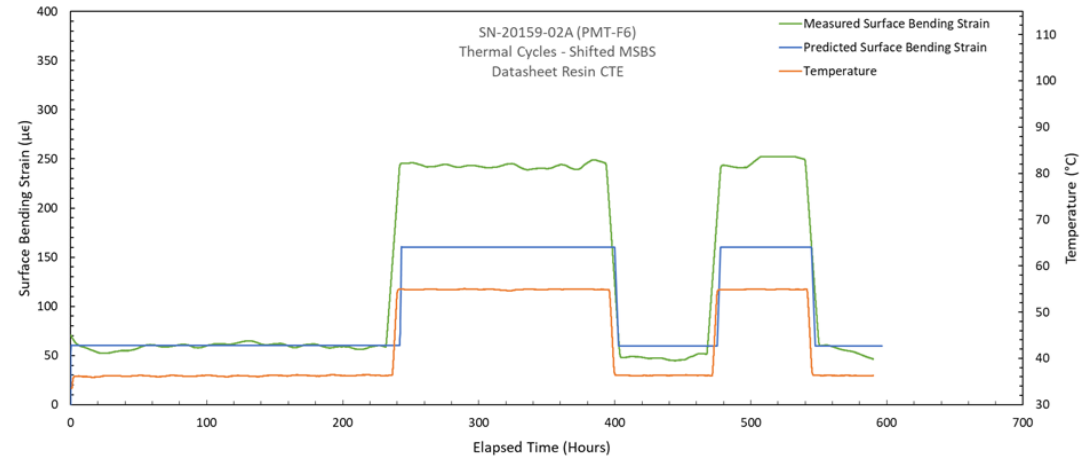

Coupon Level Material Testing

- Testing carried out over several weeks
 - How much do the polymers expand/contract?
 - How time dependent is that response?
- One coupon tested per material (3)
- Multiple thermal cycles, single moisture exposure

Coupon Level Material Testing

- What's the coupon test data for?
 - Predictions of coupon response, using datasheet material properties, compared to test data
 - Predictions tuned to accurately capture material life history
- Coupon testing agrees with edge analyses
 - EA 9394 adhesive relatively unstable compared to CFRP resins
 - Cyanate ester most stable in terms of time/temp & moisture

Resin Identifier	Assumed CTE (ppm/°C)	Calibrated CTE (ppm/°C)	Calibrated CME (ppm/%RH)
EA 9394	55.6	100	85
PMT-F6	42	63	35
PMT-F7	48	68	98

Prototype Petal Stowage

- Coupon test results informed the petal model
- All CFRP petal components and epoxy adhesive bondlines modeled
- Multiple time/temp stowage scenarios simulated
- How shape stable is the petal as a function of time/temp stowage?

* Starshade Technology Development Activity Milestone 5A: Verify Petal Pre-launch Accuracy

Prototype Petal Stowage

Petal Stowage at Tendeg

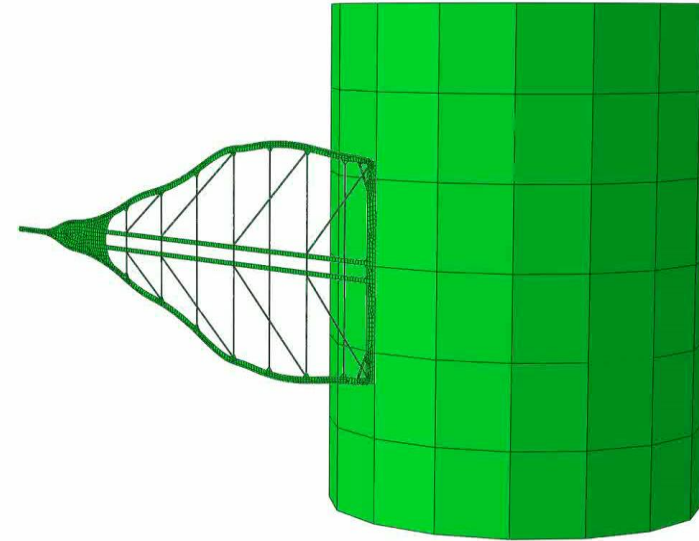

* Starshade Technology Development Activity
Milestone 5A: Verify Petal Pre-launch Accuracy

Simulated Petal Stowage

Step: Visco Roll
Increment: 0; Step Time = 0.000
Primary Var: U, U3
Deformed Var: U Deformation Scale Factor: +1.000e+00

Step: Visco Roll Frame: 0
Local Time: 0.000000

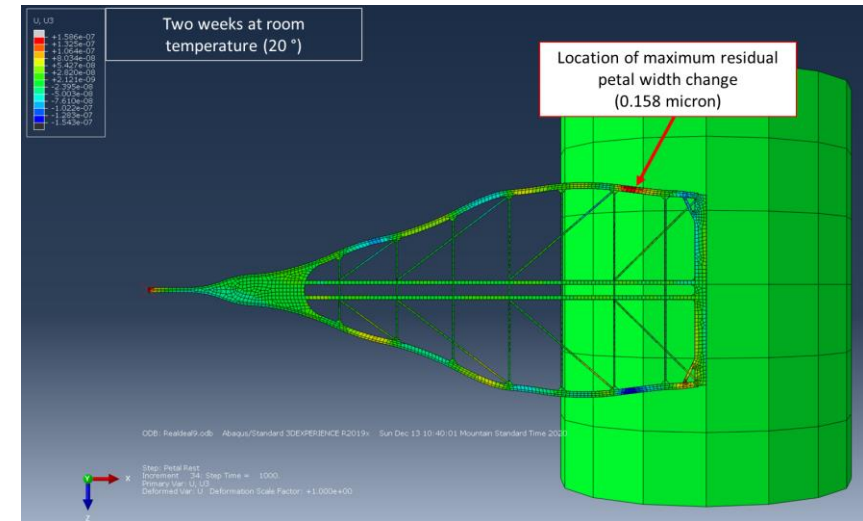

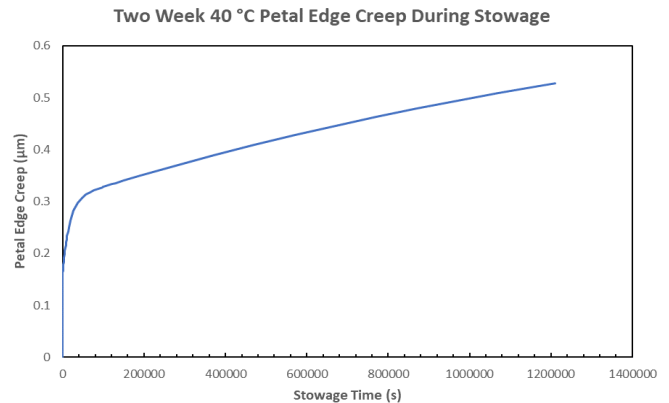

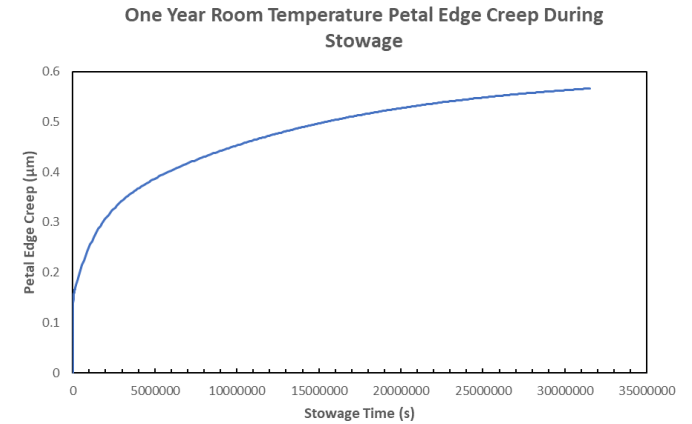

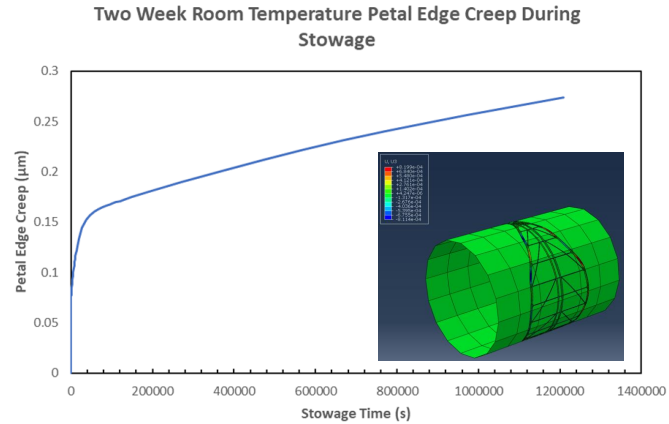

Two Week Room Temperature Petal Edge Creep During Stowage

Prototype Petal Stowage

- Three time/temp stowage sequences simulated
 - 2 weeks at room temp (20 °C)
 - 1 year at room temp (20 °C)
 - 2 weeks at 40 °C
- How much does the edge creep during stowage?
- How much creep is recovered?

Prototype Petal Stowage

Petal Edge Creep During Stowage: All Cases

Remaining Edge Creep after Deployment

Analysis Case	Max Predicted Residual Edge Creep (µm)
Two Weeks at Room Temperature (20 °C)	0.158
One Year at Room Temperature (20 °C)	0.415
Two Weeks at 40 °C	2.93

Key Outcomes

- Petal edge creep has a clear time and temperature dependency
- Short times/low temps = more elastic response = more recovery
- Long times/high temps = more viscous response = less recovery

Opterus SIP Summary

Goal: Evaluate Starshade petal dimensional stability as a function of materials and stowage

- Edge analyses showed CFRP creep orders of magnitude smaller than adhesive creep
- Coupon testing of candidate materials supplemented edge analyses
 - Most time-dependent material = epoxy adhesive (EA 9394)
 - Least time-dependent material = cyanate ester CFRP resin system
- **Petal stowage simulations, using test validated material properties, predicted residual edge deformations after deployment on the single micron scale**

Remaining Edge Creep after Deployment

Analysis Case	Max Predicted Residual Edge Creep (μm)
Two Weeks at Room Temperature (20 °C)	0.158
One Year at Room Temperature (20 °C)	0.415
Two Weeks at 40 °C	2.93
