

NASA Hi-Resolution Imaging Program Speckle Imaging on Large Telescopes

WIYN 3.5m

- Full frame readout at 1MHz
 - 1024 X 1024 EMCCDs
- Dual plate scale
 - 0.01" or 0.07" / pixel

Gemini-N 8m

- High-resolution (20mas)
- High-contrast (~12mag)
- Wide Field – up to 56"

Gemini-S 8m

Filters and data:

- u, g, r, 467, 562, H α
- i, z, 716, 832
- Provide fully reduced data

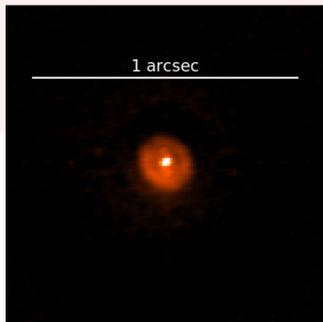

Fast ms imaging

Diffraction-limited

Optical dual-channel

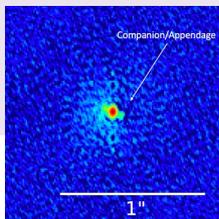

Program and Instruments Funded by the NASA Exoplanet Program Office

Nova Shell

Nova V906 Car imaged at 832nm
978 days after explosion

Asteroids

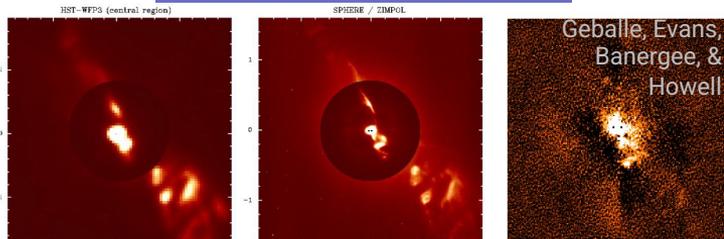

Asteroid light curves,
shapes, and binarity

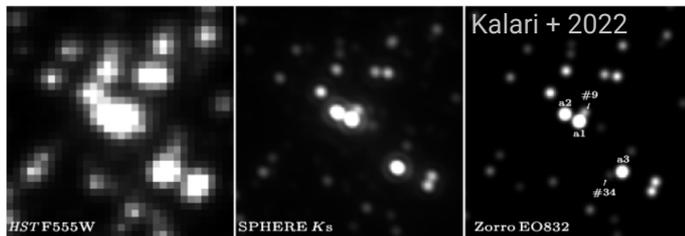

Imaging Capabilities

Provides the highest angular
resolution of any telescope

Wide-Field

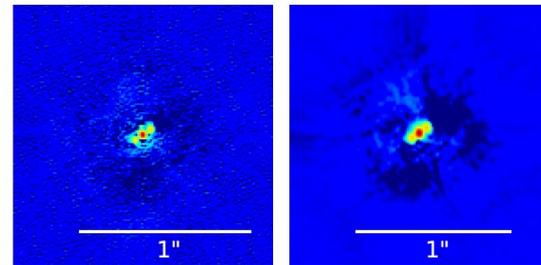

H α imaging of central 0.5" region of R Aqr

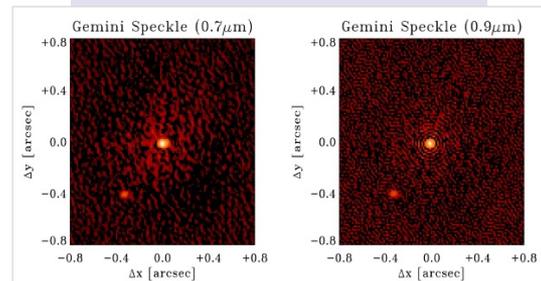

Imaging center of R136 (0.8" x 0.8")
(Tarantula Nebula)

Transient Follow-up

Follow-up imaging detected
lens and source:
sep = 0.058", contrast = 3.7

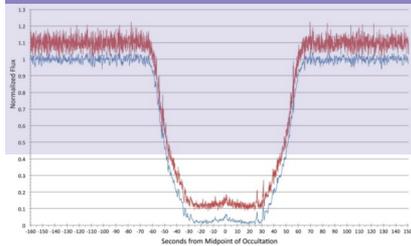

Binary Stars

Exoplanet validation, formation, and
evolution; stellar multiplicity, orbits

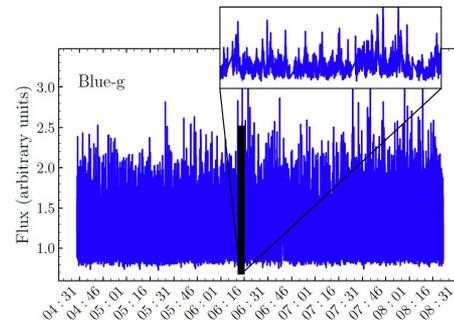

Time Domain Capabilities

Occultations

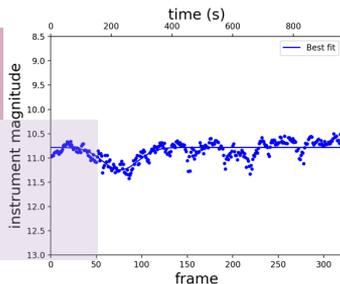

Pluto
occultation
2018

High speed and
accurate timing:
0.001s min. exp time
70nsec internal precision

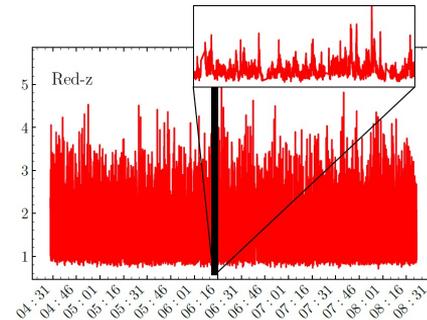

Variable Stars

Faint cataclysmic
variable NZ Boo
showing 4min eclipse

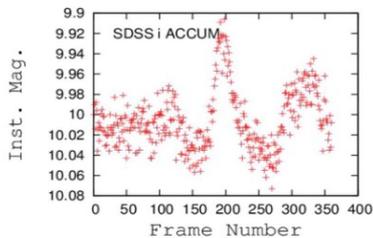

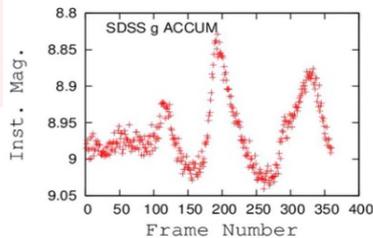

BH X-ray Binaries

4-hr simultaneous
30 sec sampled light curve
(Tetarenko, A.+ 2021)

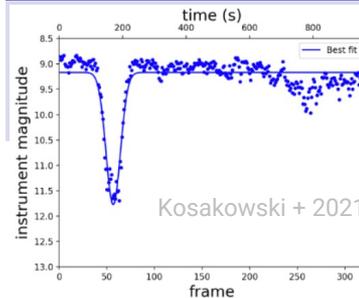

White Dwarf Pulsations

Simultaneous g
+ i light curves:
20min, 0.5s
exposures

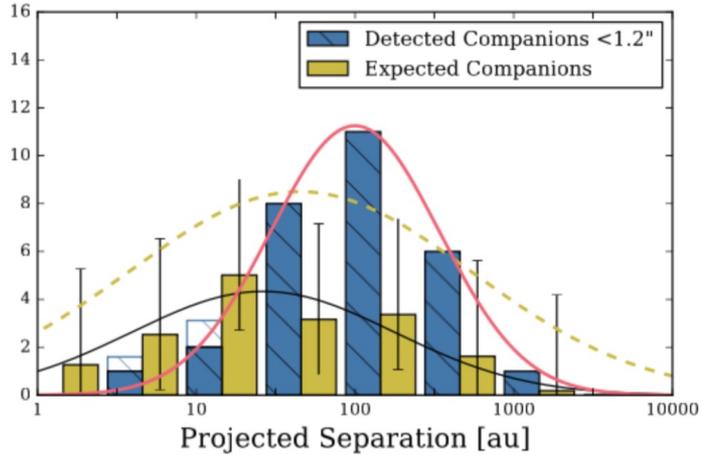

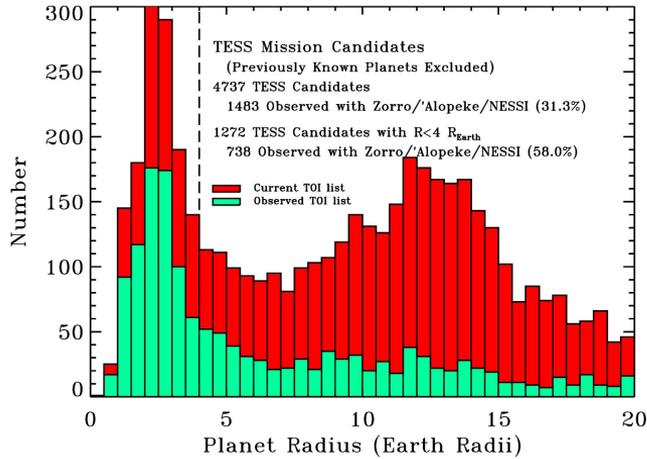

Degenerate Eclipsing Binaries

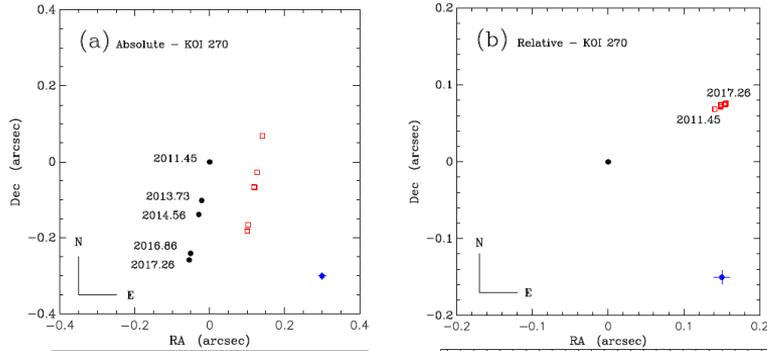

Eclipsing Double
WD
ZTFJ0220+2141
R = 19, 3.5hr,
10s exposures

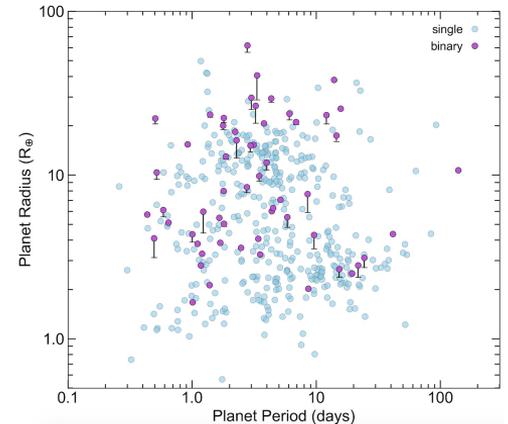

NASA Hi-Resolution Imaging Program: Emphasis on Exoplanets

Binary stars
which host exoplanets
have wider orbits.
Howell+, Lester+ 2022

Highlight bias
Against small planet
detection
in binary systems
Lester+ 2021

Perform absolute and relative +/- 1 mas astrometry (Colten+ 2021)

NASA Hi-Resolution Imaging Program - Speckle Imaging on Large Telescopes

WIYN 3.5m

Gemini-N 8m

Gemini-S 8m
