

Venus: the exoplanet in our backyard

Giada Arney
NASA Goddard Space Flight Center

Venus: A planet of extremes

Surface Temperature ~ 700 K

Clouds: ~75% sulfuric acid / 25% water

Surface pressure = 92 bars

Venus: billions of years ago?

Venus: The Life and Death of a Habitable Planet?

Venus helps us define the boundaries of habitability

What are the processes that can frustrate or maintain habitability?

Way et al. 2016; Way and DelGenio 2020

Dayside cloud-albedo feedbacks can produce **cooling** for slowly-rotating planets

ROCKE3D model

Tidally locked, *slowly rotating* exoplanets are expected to be observed by JWST.

(e.g. Yang et al 2013; Kopparapu et al 2016; Fujii et al 2017; Kopparapu et al 2017).

TRAPPIST-1 System

Inner Solar System

Cloud feedbacks on *slowly rotating* Venus may have enabled habitable conditions for billions of years (e.g. Way et al. 2016; 2020).

Illustration

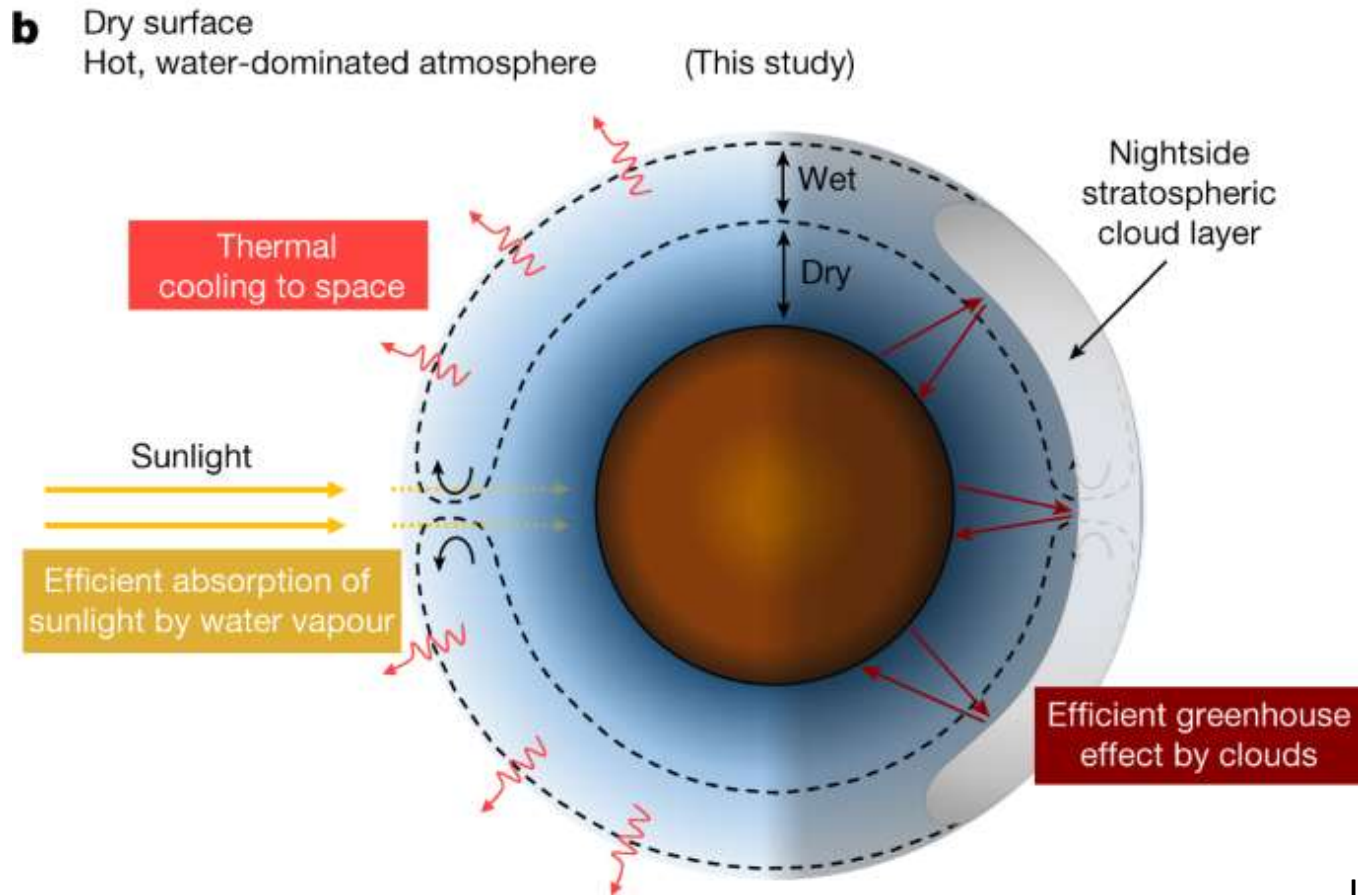

Venus helps us define the boundaries of habitability: Earths in the “Venus zone”??

What are the processes that can frustrate or maintain habitability?

Turbet et al. (2021)

Nightside stratospheric clouds can produce **warming**...the jury is still out on early Venus habitability

Selsis et al. (2023)

Modeling hot planet atmospheres is more complex than previously assumed.
Steam atmospheres cooler than previously thought.

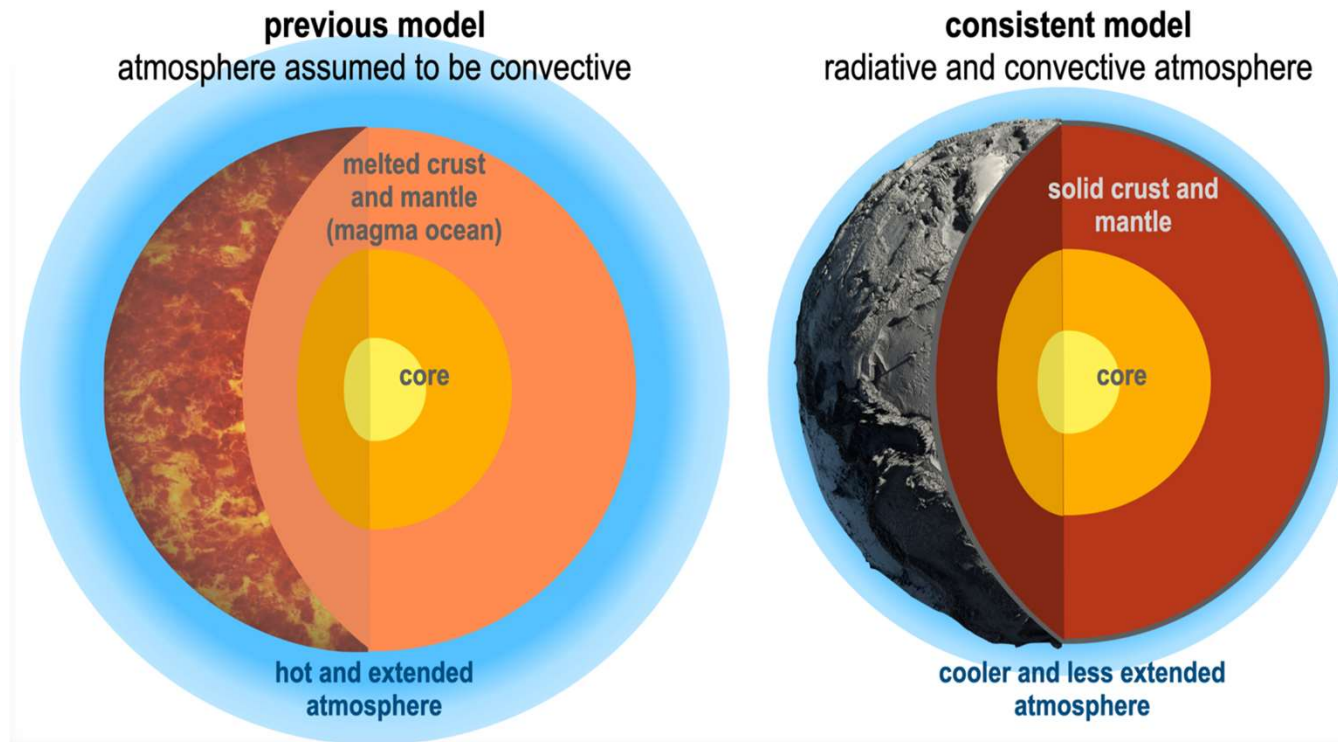

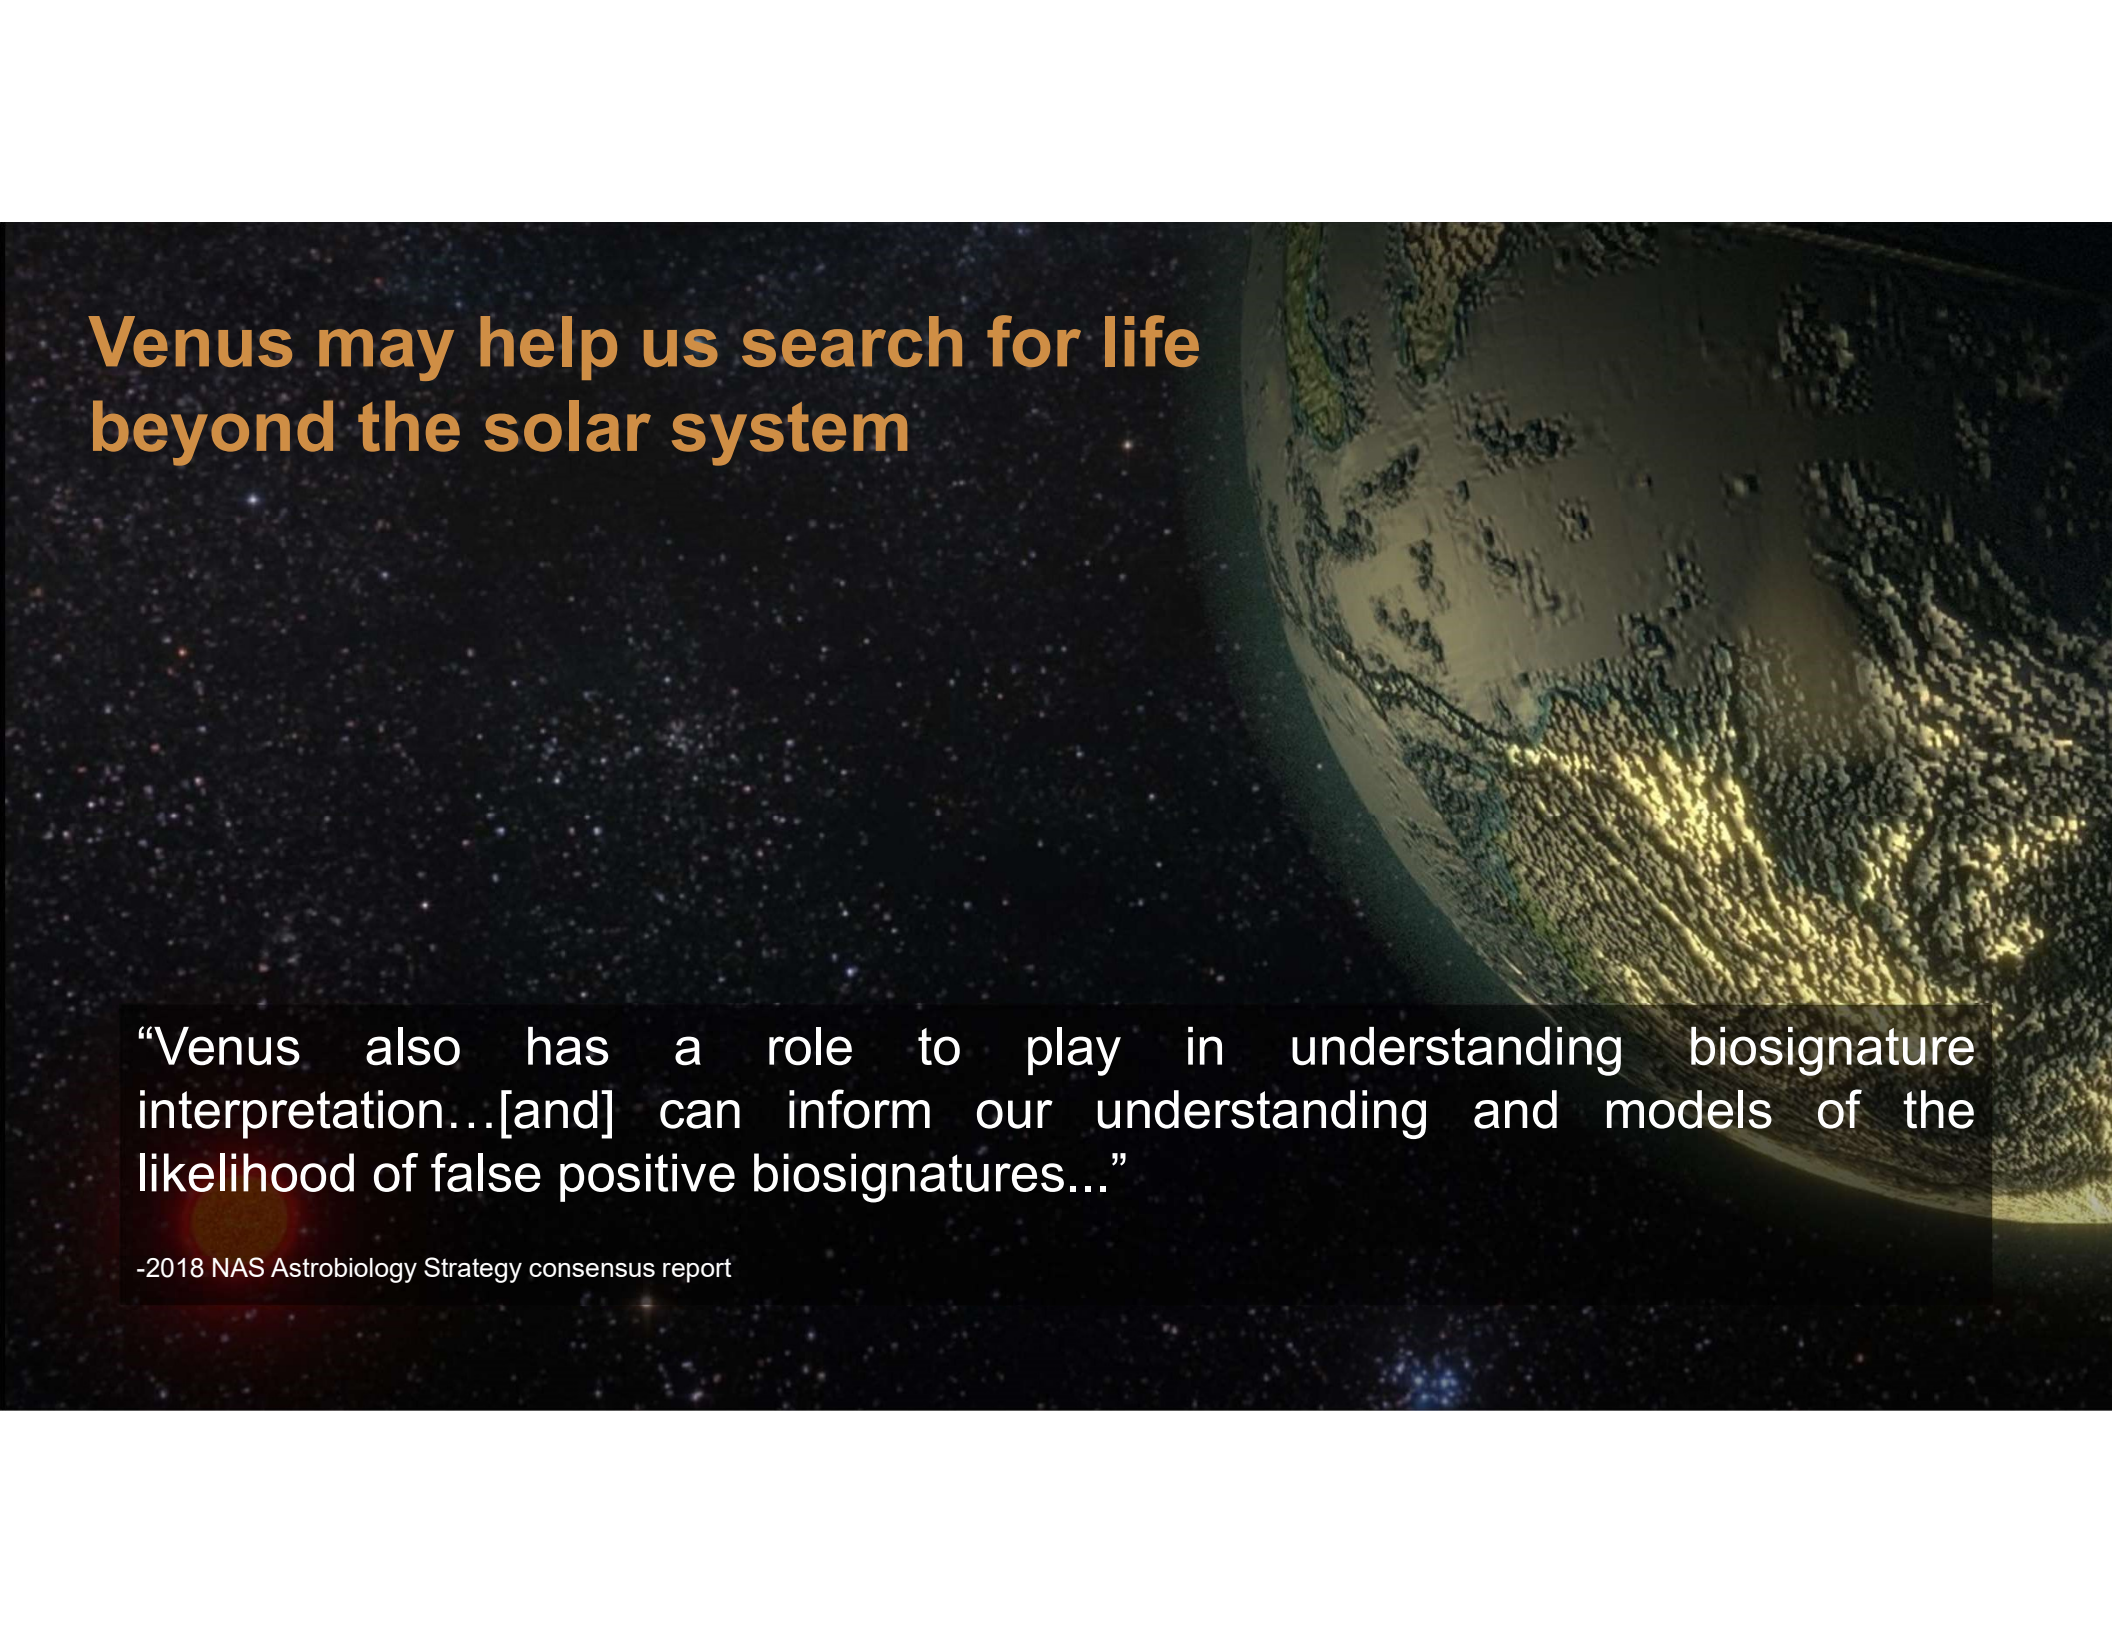

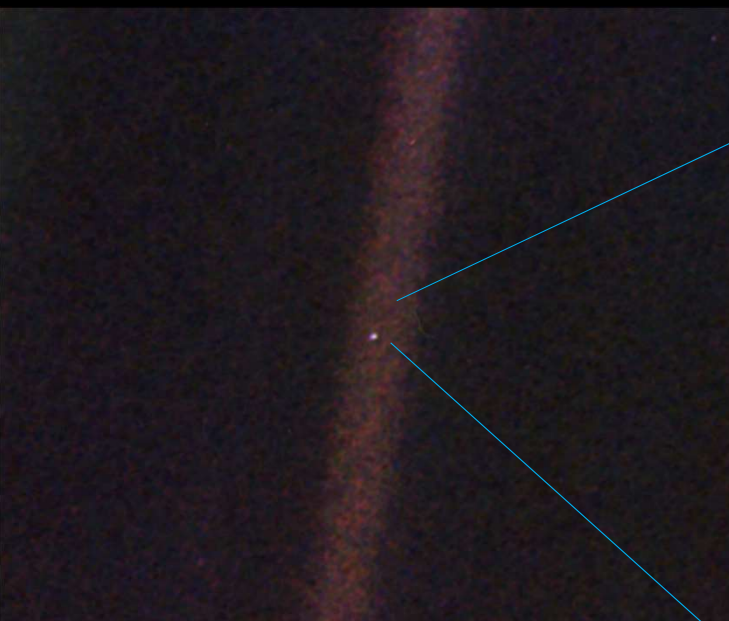

Image credit: Frank Selsis

The background of the slide is a composite image. On the right side, there is a large, curved view of Earth, showing continents and oceans. On the left side, there is a view of Venus, which appears as a bright, yellowish-white, textured sphere. The background is a dark, starry space with many small, distant stars.

Venus may help us search for life beyond the solar system

“Venus also has a role to play in understanding biosignature interpretation...[and] can inform our understanding and models of the likelihood of false positive biosignatures...”

21st Century Probe-based Chemistry, Environments, Dynamics, and Descent Imaging of Venus atmosphere + surface

“Ultimately, the assessment of whether or not a planet is habitable will need to be embedded in the context of the outcomes of terrestrial exoplanet evolution.”
- **2018 Exoplanet Science Strategy report**

Extras

The **super-luminous pre-main sequence phase** (period of contraction as the protostar is turning into a star) lasts longer for lower mass stars → can turn habitable zone planets into Venuses

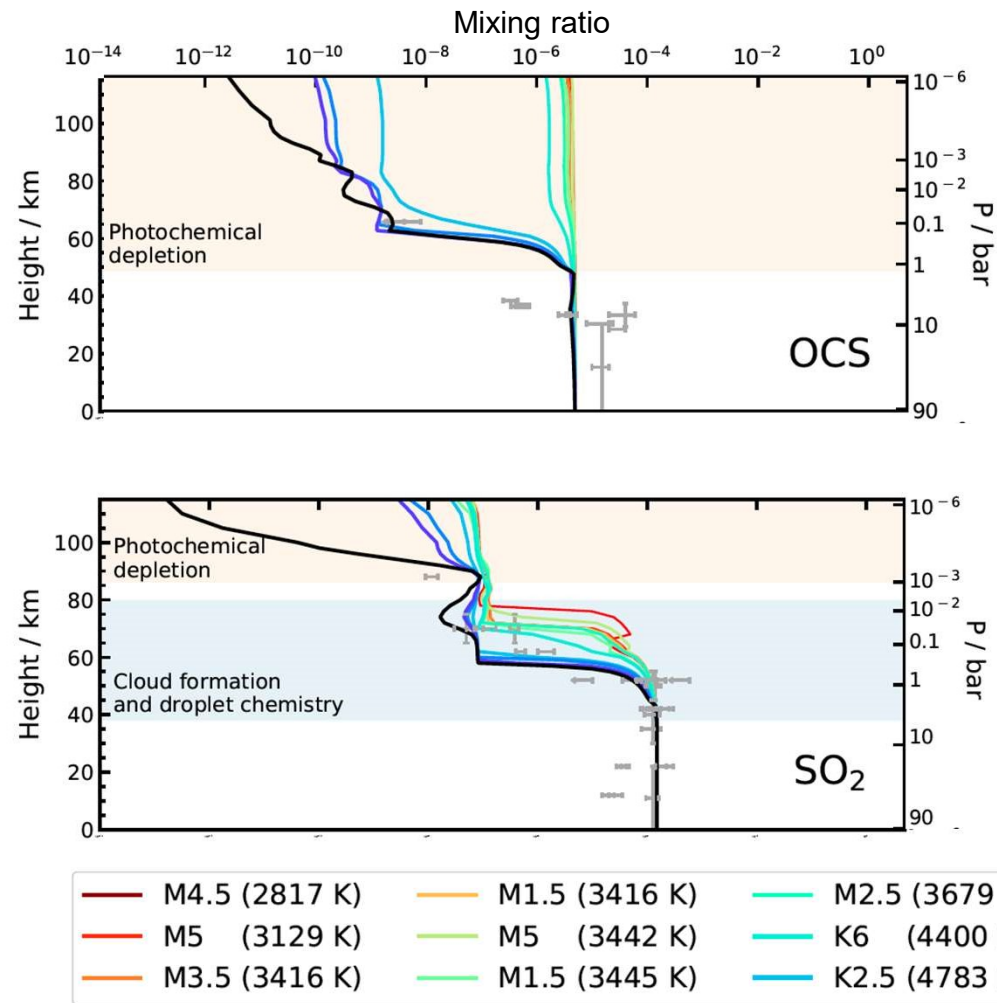

Venus helps us define the boundaries of habitability: Venuses in the “Habitable zone”??

What are the processes that can frustrate or maintain habitability?

Venus data provides ground-truth to improve models of **Exo-Venuses** that may be observed

Jordan et al. 2021
