Planets caught in the horrifying grip of an undead star

PSR B1257+12 presents

Zombie Worlds: Poltergeist, Draugr, Phobetor

These three doomed worlds were among the first and creepiest to be discovered as the orbit of an undead star, known as a pulsar. The carcass of lich, as it's called, is the collapsed core of an exploded star that hurls its twin pulsing beams of ghastly radiation and light, spinning faster than you can blink, devouring anything in their path. Poltergeist and its neighboring worlds, phobetor and draugr, are consumed with this constant radiation attack. Nothing but the undead can sustain in this most inhospitable corner of the galaxy!
